Well, first, apologies for sending it to the antenna newsgroup as I meant to send it to equipment instead... followups have been fixed.

Let me clarify my position, since you probably have not been following this issue through the years as many others of us were:

Variations of this law keep coming up every year and keep getting rejected. I belive the rejection is legit because the proposed bill treats a symptom, not a disease... asprin for a broken leg.

The disease is simple: cellular *radio* calls can be overheard by anyone with the knowledge to do so. The cure is also simple: end-to-end encryption of the call with the encryption key being chosen when the phone is activated and saved along with the rest of your account info. Encryption, not scrambling, not voice inversion... these are technical terms with specific meaning. Anything short of encryption is "security by obscurity" and solves nothing.

As for how the CTIA treats scannists, they've had an undeclared war against them. Every year, as mentioned above, they've attempted to jam legislation through to a) eliminate ALL access to public service bands, b) pot the IFs of ALL radio gear above 30 MHz, and c) "invert" the Communications Act of 1934 by requiring the law to state explicitly which frequencies can be listened to. In other words, everything is off-limits except what is stated in the law.

Now, in each of these congressional sessions, all scanner users have been universally called "electronic stalkers" with no distinction being made between neighborhood watch groups, public service watch groups, nosy neighbors, and professional theives.

Furthermore, when the Gingrich "accidental" taping occurred -- an act that broke at least two laws, the original Communications Act of 1934 and the ECPA of 1994 -- a phony "demonstration" was made to show how easy it was to monitor phone calls, and a radio dealer who caters to scannists and SWLs was filleted alive in front of a committee. It was an eye-opening sight for me and one of the reasons why I got involved.

So, yes, I have no love for the CTIA or their members.

Make no mistake: I don't, won't, nor will endorse monitoring of cell calls. I think they should be made private. Through encryption. Anyone who tells you that the phones don't have the horsepower to do it or that the individual AMPS/TDMA/CDMA boards at the cell site don't have the horsepower to do this is full of shit. CTIA is just finding it easier to buy congress than to put an additional $0.25 worth of components into each phone they sell and an addtional $100 or so of extra cost at tower infrastructure. (And that infrastructure is continually being updated... my old TDMA phone with voice inversion no longer can find any cells that support it; what little privacy structure that was available is being retired.)

As a ham, SWL and scannist, I don't like the idea of radio being
reduced to "voodo black boxes" by law. You know and I know that
anyone with a little time can get at cell calls today by using
cell phone diagnostic modes, images from receivers, UHF tuners
and so on. Cordless phones are even easier.

I want my phone calls to be private. So, let's encrypt and fix
the problem!

> That's my opinion; doubtless there are others.

That's mine!

This law is bad and there are already existing laws, which should be repealed, that block scanners. It does add to the prevention of anybody's American right to have unblocked scanners, the right available to people in other countries.

I know of no scanner with unblocked frequencies that can eavesdrop on my digital cellular or my PCS and do not see future products for non-government average Americans that can possibly do so.

This bill should be argued because Public-Safety also uses digital specialized mobile radio services and paging services for emergency and routine communications. Government must remain open to the public. They can close government more by pouring out these communication laws.

S. 2326
First, it would more then expand the definition of the frequencies that may not be scanned to include digital Personal Communications Service (PCS) frequencies as well as cellular ones. Second, the bill would strengthen that it is just as illegal to modify scanners as it is to manufacture or import unblocked scanners.

Excerpts of SEC. 2.
(a) Prohibition on Modification: modify any such device, equipment, or system in any manner
that causes such device, equipment, or system to fail to comply with such regulations.

(1) The Commission shall prescribe regulations, and review and revise such regulations as
necessary in response to subsequent changes in technology or behavior, denying equipment authorization for any scanning receiver that is capable of--

(A) receiving transmissions in the frequencies that are allocated to the domestic cellular radio telecommunications service or the
personal communications service;

(B) readily being altered to receive transmissions in such frequencies;

(C) being equipped with decoders that--

(i) convert digital specialized mobile radio service transmissions to analog voice audio; or

(ii) convert paging service transmissions to alphanumeric text; or

(2) The Commission shall, with respect to scanning receivers capable of receiving transmissions in frequencies that are used by commercial mobile services and that are shared by public safety users, examine methods, and may prescribe such regulations as may be necessary.

(3) Tampering prevention: 'capable of readily being altered' to require scanning receivers to be manufactured in a manner that effectively precludes alteration of equipment features and functions.

(c) Implementing Regulations: Not later than 90 days after the date of the enactment of this Act, the Federal
Communications Commission shall prescribe amendments to its regulations for the purposes of implementing the amendments
made by this section.

SEC. 3. UNAUTHORIZED INTERCEPTION OR PUBLICATION OF COMMUNICATIONS.

The 106th Congress Bills H.R.3489 and H.R.514 are very similar to S.2326.

We that understand the wireless radio technologies know better than what Congress has to tell you about it.

I have no idea what kind of scanner he has. And yes we could REALLY hear the conversations. Some of the frequencies he can't pick up, but there are just as many that you can.

The fact is, if anything's banned criminals and anyone else desperate enough will still be able to gain access to that particular object. This has been proven many times already.

This law would hurt many people, including sites that provide live streaming of the police bands etc. If passed, this would be one the many steps this country is taking in order to make itself a socialist nation.

Stuff like this makes me recall stories like Animal Farm and Farenheit 451, and I think the future of America is at stake.

Lots of controvery about scanning for sure. Bad people have no need for scanners. I think legislation should make it illegal for a person convicted of certain crimes (to have in their possession or be in/around a place where a scanner is present) to possess scanners. Kind of like the law banning people convicted of certain crimes from possessing bullet proof vest and/or firearms. That would be a step in the right direction.

This really shouldn't surprise anyone. Just the continuation of our government's insatiable desire to control and regulate every aspect of our lives from cradle to grave.

Too high. These are a common find at pawn shops for $60-70. $75 max, and
that's with the box and all accessories.

John, either you are a troll looking for a fight, or you are badly misinformed. The fact that you compare cellular privacy to listening to police communications on a scanner is absurd.

The Communications Act of 1934 specifically affirms the right of the public to have access to the radio frequency spectrum it owns. That means you and me John.

We are the people who own the spectrum, not the CTIA and not the local police department. The Communications Act re-write of 1998 again reaffirmed public safety comms are in the public domain. Every bill that has been voted on specifically leaves that portion of the spectrum intact for public access. You don't think encryption is practical? You obviously haven't talked to anyone using Astro digital trunked systems, for instance. Is your cellular phone digital? Try to hear it with ANY scanner! You can't, period.

Besides, most law enforcement agencies realize the value of having extra eyes and ears in the scanning public helping them identify and locate criminals. Of course sensitive comms should be secure, but even the military realizes that secure comms are the responsibility, and indeed the burden, of the sender. Making something "illegal" never has, and never will, guarantee that is cease to exist.

Do you think for one minute the ECPA of 1986 and subsequent legislation really gives cellular customers REAL privacy? Of course not, but idiots like Tom Wheeler of the CTIA keep wasting money on ridiculous political solutions to the issue of privacy when that issue could have been solved long ago by spending that money on going digital, which they have done anyway, making all that legislation a moot point!

I agree that phone calls should be private, but telling people they cannot listen in on a scanner is simply avoiding the real issue.

You want privacy? Tell your cellular provider that you won't settle for anything less than full digital! Don't shove the issue back on scanner owners, bitching about it doesn't make it reality!

As far your opposition to listening in on police, it doesn't take a whole lot of smarts to know what every single totalitarian regime has ever done first, limit the public's information. The rest is real easy to figure out. Thank God, your opinion is a minuscule minority, and common sense has prevailed. Let's all hope it continues to do so.

Jon

I think that's a ridiculous statement to make. You're saying that people who exercise their first amendment right to even discuss something are part of the problem? I don't think so.

People need to treat cell phone communications like they do Internet communications. Assume that anything you say can and will be heard. If one is naive enough to broadcast their most inner thoughts and feelings over the public airwaves then they get exactly what they deserve. If you're concerned about security, go digital.

If Cell companies had encrypted their transmissions from the beginning we wouldn't even be discussing this. Building tools for decryption is already protected under current intellectual property laws. To say that someone cannot monitor an open, un-encrypted signal is crazy. And it has been a crazy law since the ECPA was passed.

I use an analog cell phone all the time. I am aware that what I say can and will be heard so I watch what I say when I am on the phone. Others should do the same.

The true problem here is not cell phone monitors, cell phone companies, or anyone else. The true problem is what it typically is... Washington.

What are we going to do require a yearly license for scanners? Since scanners
can be used to find out where DUI check points or speed traps are at is
everybody that has ever received a traffic ticket going to be excluded?

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET groups
rec.radio.scanner, alt.radio.scanner, and rec.radio.info.
It is also available electronically from the
rec.radio.scanner ftp archive on the official USENET FAQ
library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article discusses the purchase of used scanner radios
and includes these topics:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase
most of my receivers at hamfests or horsetrade with other

radio hobbyists.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Radio Shack repairs scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

You may be able to obtain manuals for older Midland scanners from:

Midland Consumer Radio Products
1670, North Topping,
Kansas City,
MO: 64120

Phone: 816-241-8500

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series (see US patent 4,011,515, granted 3/8/77). Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the

scanner in binary form. Some models, like the Tennelec MCP-1 (see US patent 3,961,261, granted 6/1/76), Bearcat BC-101 (see US patent 4,179,662, granted 8/4/78), and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. See US patent 4,057,760, granted 11/8/77. The GRE-manufactured SBE Optiscan (and its Sears clone) required poking or covering a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000, R7100, and R8500. The ICOM models

are more "communications receiver" than a conventional scanner.

For portable use, I prefer Uniden/Bearcat BC3000XLT and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

Electra Corporation stocks crystals for the Bearcat scanners:

Electra Corporation
11915 E. Washington St.
Cumberland, IN 46229
Phone 317-894-3229

Crystals for Bearcat and other models are available from:

American Crystal Co.
1623 Central Ave.
Kansas City, KS 66102
tel. 913-342-5493

Bomar Crystal Company
201 Blackford Ave.
Middlesex, NJ 08846
tel. 908-356-7787

Cal Crystal Lab Inc.
1142 N. Gilbert St.
Anaheim, CA 92801
tel. 714-991-1580

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

G & G Communications
9247 Glenwood Drive
LeRoy, NY 14482.

tel. 716-768-8151

Jan Crystals
Box #-6017
Fort Myers, FL 33911
tel. 941-936-2397

Monitor Crystal Svc
124 W Walnut St Watseka, IL 60970
tel. 815-432-5296

Short product summaries for over 70 scanner models appear in
a separate article, entitled "Scanner Radio Review Briefs."
You may share information with scanner collectors via the
"vintagescanners" mailing list at:

http://www.onelist.com/group/vintagescanners

For more information about old scanners, see:

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 1999 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

One way to roughly estimate a radio's age is to examine the
4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most

recent date stamp.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation sells crystals, antennas, power cords, owner's manuals ($11 ea) for some older (pre-Uniden) Bearcat scanners. Electra Corporation is located at 11915 E. Washington St., Cumberland, IN 46229. Phone 317-894-3229.

I cannot furnish schematics, manuals or parts. To order a user manual for an Electra/Bearcat scanner from Uniden, call (800)235-3874 extension 2553. You can also download an electronic copy of the user manual for recent Bearcat models from the Uniden web site:

http://www.uniden.com/docs/service/support.htm

Some schematic diagrams may be obtained from Uniden's parts department, (800)297-1023. Uniden currently charges a flat rate of $54 for scanner repairs. They will repair and return "out of warranty" items without an estimate unless the repair charges exceed the flat rate charges.

The phone number for repair is (800)297-1023, too. I recommend you call repair before sending the broken scanner. Items for repair via UPS (include receipt if still under warranty) are usually sent to:

Uniden America Corp.
4700 Amon Carter Blvd.
P.O. Box 95002
Fort Worth, TX 76155

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and

2. a "feature board" containing the microprocessor controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Matt Roberds fixed a BC220 which experienced memory loss if power was removed by resoldering the positive wire to 2-AA battery holder.

As built, the BC220 logic board is grounded only through its mounting screws. In the BC220, Matt recommends adding real wire ground jumpers from the main board to the feature (logic) board to fix grounding problems.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. See March 1996 Monitoring Times magazine for BC800XLT capacitor locations and repair information.

The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

Jim Craig and Karl Klein repaired their BC210XWs by replacing the 22uF/35V C98 capacitor.

Paul Grohe replaced a failed C98 with a low ESR (equivalent series resistance), high frequency, switching regulator grade capacitor, e.g. a Panasonic HF series capacitor. He also recommends adding a 0.1 ceramic capacitor in parallel with C98.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Failure of IC9, the 9 volt NJM78M09A regulator in a BC800XLT is another cause of a blank display.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This display is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of

a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Matt Roberds repaired the Montgomery Wards version of a BC220 and contributed these insights:

"I did add some heat-sinks, but you have to be careful what you do with the TIP29 on the logic board. I added a long, flat heatsink to it and immediately created a whine in the audio. I didn't use an insulator, as this was a temporary first-try. As far as I can tell, the heatsink was radiating noise from the logic board into the front end on the radio board, which ended up being just below the heatsink. Bypassing the TIP29 (a voltage regulator) with disc ceramics didn't work; using a smaller heatsink and an insulator fixed the problem."

"There is also a 220 ohm 1/4 watt resistor on the logic board. It feeds the TIP29 from the main +16v supply. It looked a little crispy. I pulled one end and measured the current through it and it was about 30-35 mA. This works out to right at 0.2-0.25 watt dissipation. I didn't have a higher-wattage resistor, so I substituted 2 470-ohm resistors in parallel."

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Uniden/Bearcat BC200XLT Portable
Loss of Audio and Dial Lamp

If you can program frequencies into your BC200XLT but there is no audio and the green backlight no longer functions, a tiny transistor may have failed.

Check for a defective PNP surface mount transistor, Q201 (2SB815B6-YDY). Q201 is used as a switch to furnish 8 VDC to several stages of the BC200XLT. Its main purpose is to

switch off power hungry stages of the BC200XLT when the CPU thinks the NiCd voltage has fallen below a threshhold. That's an attempt to limit the current drain on weak NiCds to avoid permanent damage.

Q201 is located on the foil side of the "Micom" board, adjacent to the black multi-pin connector which mates the Micom and main boards together.

Q201 can be destroyed by a few different causes, primarily, by something in the scanner drawing too much current through it. In one case, capacitor C36 shorted. It's a 220 uF 10v electrolytic, located on the component side of the main board, connected from pin 8 of the audio IC (IC2 NJM386SL) to ground. Capacitor C55 shorted in another BC200XLT. Gary Bean reports he substituted a 2SA1298 for Q201 and it worked fine. In a pinch you bypass Q201 by soldering a short piece of bare wire between the collector and emitter, but you must first fix the component which caused Q201 to fail.

BC9000XLT: Loss of Sensitivity

John Ward has fixed two BC9000XLTs which suffered from "low sensitivity." He fixed the solder joint where the antenna jack connects to the circuit board. In both cases the tab from the board was on the opposite side of the jack from where the little blob of solder applied at the factory was located.

It was an intermittent problem that depended upon the position of the antenna cable - if the weight of the cable placed tension on the jack in one direction contact was made and the radio worked fine. If the cable placed tension on the jack in the opposite direction contact was lost and so was reception. The gap was barely noticeable.

Other Problems

Complaints of low audio output and occasional microphonics in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier activated relay inside the BC890XLT wore out. Andy found the identical relay sold at Radio Shack (part #275-232) and says the BC9000XLT uses the same relay, too.

Replacement Bulbs for BC760XLT

The Uniden BC760XLT's SCAN, MAN, PRI, and HOLD buttons are illuminated by "grain of wheat" type incandescent bulbs. Gary Saffer reports that the bulbs and buttons are located on a small printed circuit board which sits behind the radio's face plate. Gary unsoldered the burned out bulbs in his radio and replaced them with 12 volt Radio Shack bulbs (#272-1092c). They should last a long time when powered by the 8 VDC supplied by the BC760XLT.

Open Resistor in BC140

Robert Casey fixed his deaf, 16 channel Bearcat BC140 scanner. A 10 ohm resistor had opened that fed a circuit that generates 22V for the varactor diode tuner circuits. Without the 22V, there was no tuning of the local oscillator and front end, and no reception. What he did was compare voltages to a second working BC140.

Sources for Replacement NiCd Battery Packs

Replacement NiCd battery packs and inserts for the BC100XLT, BC200XLT, BC2500XLT, BC3000XLT, and other scanners are available from Uniden. I've purchased them at lower cost from:

1. Mr. NiCd - E. H. Yost and Company, 2211-D Parview Rd., Middleton, WI 53562. tel. (608)831-3443. email ehyost@midplains.net

2. Battery-Tech Central, 2818 Southland Street SW, Cedar Rapids, IA 52404-4141. tel. (800)267-3087 or (319)364-0855. *

Batteries Plus has stores across they country and some have rebuilt Uniden NiCd packs for under $20.

I am often asked, "How do you find these frequencies?"
This article answers the question in various sections:

Books
Magazines
Government Records
Web Sites
Federal Radio Stations
Radio Clubs
Do Your Own Sleuthing
What Makes Station Identification Difficult?
Examine the FCC License on Premise
Examine the Labels on Radio Equipment
Examine the Antenna to Determine Frequency Band
Equipment to Determine Frequency Usage
How Can I Determine To Whom I'm Listening? - An Example
Summary
Addresses

Books

The most convenient source of fire and police frequencies
is the Police Call Plus, published each year in 9 regional
volumes by Hollins Radio Data, and sold at Radio Shack and

larger book stores for under $13. Police Call Plus is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. A few pages of local airport and nonsensitive federal government frequencies are included. Selected business frequencies are listed, too, but without callsigns and other details.

I highly recommend Richard Barnett's book, Monitor America, published by Scanner Master Corp. A 3rd edition is available from Grove Enterprises for about $30. It is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the Radio Communications Monitoring Association (RCMA), now defunt. Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call Plus, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The longstanding source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It

is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and the sensationalistic Popular Communications magazines.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM instead.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100.

The PerCon Spectrum CDROM sells for under $30 and contains a handful of fields for every FCC license in the US. However, Public Safety license information contained in the Winter 1996 Spectrum doesn't appear as up to date as in the 1997 Police Call Plus.

Spectrum works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at

http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)

dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes and extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Web Sites

If you have access to the World Wide Web, you can visit dozens of sites with local frequency lists. You can look up civilian aero frequencies for specific airports at: http://www.airnav.com/airports/.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'. (See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information

is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA), now out of business. There are several regional scanner clubs, spun off from the former RCMA, which hold regular meetings.

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available on the WWW page http://aosc.rpmdp.com and from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the

channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75

recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel

pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Examine the Antenna to Determine Frequency Band

You can often determine a transmitter's frequency band by the size and type of antenna used.

The Police Call Plus book contains sketches of antennas. Antenna catalogs are crammed full with antenna pictures and specifications and they are usually free. Contact Antenna Specialists (216-349-8400), Cushcraft (603-627-7877), Tessco (800-472-7373), Maxrad, Larsen Electronics (800-426-1656), and other companies in the land mobile equipment business.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found

during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my

shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

In the 1960s and 1970s, thousands of firemen and ambulance
squad members came to rely on their crystal controlled,
transistor Plectron and Motorola desktop monitor receivers.
They have now been replaced by battery operated portable
pagers, and the desktop models are often available at
hamfests in the $5 - $25 range. Since many are in rough
condition and need repair, a hamfest special is better
suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are
excellent for dedicated monitoring of local frequencies --
a task for which you wouldn't want to tie up your 400
channel programmable scanner. They are desktop models
which can be powered from 117VAC or 12VDC with the proper
mobile cord. The audio quality of a Plectron P1, Plectron
700 series, and Motorola Alert Monitor is far better than
any consumer grade scanner and the sensitivity, image
rejection, and intermod immunity is outstanding when
aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band
receivers: VHF-low, VHF-high, or UHF. No single Plectron
or Motorola Alert monitor can cover the entire 30-50 MHz

band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the 700 and R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal

scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

The tape recorder inside the Receiver/Recorder employs two rubber belts. The Projector Recorder Belt Company makes replacement belts which work fine, though they may not be the original equipment:

1. PRB SCA8.6 (218 mm)
2. PRB SCQ 2.5 (64 mm)

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Crystals

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

The best source for crystals is:

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

You need not bother with calculating the crystal
fundamental frequency. Merely supply International with
the exact receiver model number, printed on the rear label,
and the frequency you want to monitor. They will perform
the necessary calculations.

Crystals for Plectrons

The Plectron P1 series contain two crystals. The second
local oscillator crystal is 11.155 MHz regardless of band.
On VHF high band (148 - 175 MHz), the P1 series employ this
formula for the first local oscillator crystal:

Crystal frequency (MHz)
= (station freq (MHz) + 10.7) / 4

or

Crystal frequency (MHz)
= (station freq (MHz) - 10.7) / 4

On VHF low band (25 - 54 MHz), the P1 series employ this
formula for the first local oscillator crystal:

Crystal frequency (MHz) = (station freq (MHz) + 10.7)

or

Crystal frequency (MHz) = (station freq (MHz) - 10.7)

There are two crystals (Y1, Y2) used in the Plectron R700
series, one for each local oscillator. The crystal
formulas are:

RF Range (MHz) Y1 (MHz) Y2 (MHz)
_____
25-29 (f+10.7)/3 11.155
29-32.6 (f+10.7)/3 11.155
32.5-35 (f-10.7)/2 10.245
35-41 (f-10.7)/2 11.155
41-47 (f-10.7)/2 11.155 (use 10.245 MHz
for Y2 on 44.62 MHz)
47-54 (f-10.7)/3 11.155
148-158 (f-10.7)/9 11.155
158-175 (f-10.7)/9 10.245
450-470 (f-10.7)/18 11.155

The economy Plectron 500 series use this scheme for the
first local oscillator crystal:

RF Range (MHz) Crystal (MHz)

---

25 - 35 (f+10.7)
35 - 54 (f-10.7)
148 - 174 (f-10.7)/4

Most Plectron 500s use an 11.155 MHz second local oscillator crystal. However, a 10.245 MHz crystal is used instead for receivers in these ranges: 33.4 - 33.78, 44.62, and 158.78 - 158.82 MHz.

Power Cords

AC power cords for both types of receivers use unique connectors and are scarce. I published the pinout for both Plectron and Motorola Alert Monitor receivers in June 1998 Monitoring Times magazine.

You can buy the proper replacement power cords but it's much cheaper to drill a hole on the rear panel and solder on a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

Squelch and Minimum Volume Setting

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely

silence the receiver at minimum setting of the volume control.

Tone Alert Feature

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair and Replacement Parts

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics
PO Box 212
5138 Laurel Ln.
Broad Run, VA 20137
telephone (540) 347-7760
email: weber@citizen.infi.net

Alert Monitor parts are available from Motorola. Phone (800)972-3226.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model UHF VHF-high VHF-low

SM-301 X X X
SM-302 X X
SM-303 X X
SM-304 X X

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from the crystals used in the conventional single channel

Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) /
10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

Plectron Alternatives

Too bad Plectron is out of business. TCS Communications
Corp. sells used Plectron receivers, in working condition,
for $75-100. If you require crystals or reeds, TCS may be
able to find some types/frequencies. Contact:

Terry Marengi
TCS Communications Corp.
tel. 1-800-TCS-XMIT
email: TERRYTCS@aol.com

If you wish to purchase a new receiver with "Plectron-like"
signaling capabilities, contact Reach Electronics:

Reach Electronics
1311 West Pacific
Lexington, NE 68850
(308) 324-6661
(800) 445-0007
FAX: (308) 324-4985

Reach sells tone & voice pagers, Alert monitors, and
ENCODERS. They also do contract manufacturing.

I currently have no Plectrons or Motorola Alert Monitors
for sale. I'm hoarding them. :-)

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1999 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the RCMA Newsletter, December 1988. It may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, sci.electronics.repair, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

4. If space permits, you can replace the stock resistor with a higher value variable resistor ("trimpot") and adjust to suit.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers		
Receiver Model No.	Res-istor Value	Stock Comments
Radio Shack PRO-24	R35	33K replace with 220K. Located between pins 12 and 14

	of MC3357 (IC1)
Radio Shack PRO-2002	R197 47K try 220K.
Radio Shack PRO-2004	R148 47K remove R148
	or replace with 220K.
	On linear board,
	between pins 12 & 14
	of TK10420 (IC2)
Radio Shack PRO-2006	R152 33K try 100K or higher.
Radio Shack PRO-2022	R91 33K replace 33K
	with 220K.
	Between pins 12 & 14
	on IC-1 MC3361
Radio Shack PRO-2035	100K replace 100K
	with 220K.

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA.
High level overviews of the following topics are presented:

Why Scanning?
Is Scanning Legal?
What Scanner Should I Buy?
What is a CTCSS and DCS Tone Squelch Feature?
How Do I Determine the Proper CTCSS or DCS Code?
Scanner Antennas
Coaxial Cable Feedlines
Where Can I Buy A Scanner?
Modifying Your Scanner
Scanner Repair Shops
Where Can I Obtain Frequency Information?
Do Your Own Frequency Detective Work
How Can I Use Equipment to Uncover New Frequencies?
Scanner Clubs and Mailing Lists

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,
```

taxis, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, neighbor and domestic disputes, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a team of G-men protect the president while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies.

It is illegal for companies to sell or import into the USA recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

The rules define "readily altered by the user" as "clipping the leads of, or installing, a simple component such as a diode, resistor and/or jumper wire; replacing a plug-in semiconductor chip; or programming a semiconductor chip using special access codes or an external device, such as a personal computer."

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations and the AR5000 works well.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. Beware of low cost programmables which can't search. Some models, like the early Uniden SportCats and Radio Shack PRO-2046, allow searching between limits, but the limits are factory programmed and cannot be altered.

Get a model which covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 50 channel scanner will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate. The $1500 Icom R8500 and $2000 AOR AR5000 models are exceptions.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC895XLT, BC245XLT, SC200, and Radio Shack PRO-91 and PRO-94 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites. The ICOM IC-R2 and Yaesu VR-500 are the two smallest "pocket" scanners which perform. Both are tiny enough to fit comfortably in a shirt pocket so you can monitor without attracting undue attention.

Looking for value? At $170 discount price, the 100 channel Uniden/Bearcat BC278CLT base is a good value and available at most Sears and Best Buy stores. The Uniden Sportcat SC200 portable performs very well is an excellent value at its $220 street price.

CTCSS and DCS Tone Squelch Feature

Upscale scanners can be optioned with a subaudible tone decoding squelch circuit. There are two types: CTCSS (Continuous Tone Coded Squelch System) and DCS (Digital Coded Squelch). In simple terms, this feature lets your

scanner ignore signals you don't want to hear.

Most land mobile two way radios, except trunked systems, transmit either CTCSS or DCS signals subaudibly along with the voice information. U.S. military field radios employ wider deviation and a 150 Hz CTCSS tone, not supported by most scanners or CTCSS decoders.

There are over 40 different CTCSS codes and you can program a specific CTCSS or DCS code into each memory channel. Using a CTCSS or DCS decoder permits your scanner to open the squelch only if the transmission has a code which matches the code you program.

CTCSS and DCS decoding offers several advantages:

1. Ignore unwanted signals on shared frequencies: It is common for several users to share the same frequency, e.g., my county sheriff uses the same frequency as Chicago Police, located about 60 miles away. I want to hear my sheriff's transmissions but don't want the scanner to stop on or listen to Chicago Police transmissions. This is especially a problem when radio propagation is good, e.g., during a "band opening," when reception range is temporarily increased.

2. Combat intermodulation interference: Helps keep out intermod and image interference from strong pagers and other signals which are not transmitted with a matching code.

3. Ignore scrambled transmissions: Many federal law enforcement agencies (FBI, Secret Service, etc) and some local police agencies employ digital voice scrambling, which sounds like white noise and is annoying to hear. The CTCSS or DCS code is sent only when the station is transmitting unscrambled, or "in the clear." You can program federal frequencies along with the proper code into your decoder-equipped scanner so you won't have to listen to the scrambled mess and only hear their transmissions when they are unscrambled.

CTCSS also goes by various tradenames: Motorola's PL (Private Line), GE's Channel Guard, and RCA's Quiet Channel. Motorola uses the tradename DPL (Digital Private Line) for its digital coded squelch.

How Do I Determine the Proper CTCSS or DCS Code?

There are a few ways to determine the CTCSS or DCS code transmitted by a station:

1. Use an outboard CTCSS/DCS reader which must be attached to the discriminator output circuitry inside the scanner. The reader has an LCD or LED display which indicates the code when a station transmits. I use a CSI model CD-1 Communications Decoder Unit, an an excellent reader which sells new for about $200. (Connect Systems Inc., Ventura, CA, 800-545-1349, http://www.connectsystems.com).
2. Many of the ScannerMaster guides, as well as scanner club newsletters, print the CTCSS codes used by transmitting stations.
3. On some scanners equipped with the CTCSS squelch, you can program into memory the frequency of interest. Then you "tune" slowly through all the different CTCSS and/or DCS codes until the squelch opens and you hear the dispatcher talking. This is a slow process and the station has to keep transmitting during it.
4. A slow, brute force method is to program the same frequency but a different CTCSS code into several channels and see where your scanner stops.
5. In some cases, I've actually examined the walkie-talkies I want to monitor and found the CTCSS code printed on a label on or inside the radio.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer these alternative antennas for use with portable scanners:

1. The Icom FA-1433B dual band flex antenna, a thin and very flexible rubber antenna, is slightly longer than a stock heliflex but provides better performance. The Premier (Prime) RD-9 and RD-9SMA are about the same length but even thinner.
2. The Austin Condor is a 12" long rubberized antenna available for about $30. While considerably longer than the stock antenna and the FA-1443B, the Condor is very flexible and provides VHF-high band reception superior to both. It is not designed to cover the VHF-low band, but will allow reception there at least as good as shorter antennas. The Austin Condor is available from Grove Enterprises.
3. The "Thin-Stick" is an 18 inch telescoping antenna for extended range. It is made in USA by Smiley Antenna Co., Inc. and is designed to cover both the 2 meter

and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A (available from Amateur Electronic Supply) or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 50 miles or more, depending on terrain. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U, e.g., Belden type 8267, has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Be sure it is on sale, as Radio Shack list prices are high and their scanners are offered at reduced prices by mail order discounters.

Discount chain stores like Wal-Mart, Best Buy, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902. For a free catalog, call (828)837-9200. Telephone (orders only): (800)438-8155. Web page is http://www.grove-ent.com

- National Electronics (formerly National Tower Company), PO Box 15417, Shawnee Mission, KS 66215. Telephone (800)762-5049, (913)888-8864. Web page is http://www.sound.net/~ne/

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411. Web page is http://www.aesham.com

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. Modifying any scanner to receive cellular phone signals is now considered illegal. By federal regulation, new scanner models must be designed to they cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/hamradio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the

Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here is one company which repairs scanners:

- G & G Communications (telephone 716-768-8151) - (http://www.iinc.com/ggcomm or email ggcomm@iinc.com or ggcomm@aol.com) This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 7825 Black Street Rd., LeRoy, NY 14482.

Repair tips for Bearcat and Radio Shack scanners are discussed in two other FAQ articles.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores. The newest editions contain abbreviated business listings, too, although callsigns and other details are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial

broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 828-837-9200, http://www.grove-ent.com) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning (NatScan) is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the

public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM. The PerCon Spectrum CDROM sells for under $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM, too.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)

dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes an extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an

invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at

the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs or Mailing List?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

Clay Irving <clay@panix.com> administers a scanner electronic mailing list, called "scanning." To subscribe, send an Email message to: majordomo@lists.panix.com

In the body of the Email message, put: subscribe scanning

Other scanner mailing lists include: scanner@onelist.com, scan-l@onelist.com, scanner@qth.net, and sonofrcma@onelist.com.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about

4 PM. You must purchase a lunch since we get the room for

- 2 -

free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. You can obtain an electronic subscription to the CARMA Newsletter. For more info, see:

http://www.TheRamp.net/shabec/carma.htm

The club's mailing address is:

CARMA
P.O. Box 2681
Glenview, IL 60025

All 1999 meetings (except August) will be held on Saturdays at Phillies Pizza, 6300S. Kingery Highway, located in the shopping center at the corner Rt. 83 and 53rd St. in Willowbrook, IL,

The 1999 meeting schedule is: April 3, June 5 (picnic at Argonne National Labs), August 7, October 2, and December 4.

The CARMA Picnic will be June 5th, 1999 at the Argonne National Labs Picnic Pavilion, Cass Avenue, south of I-55 in or around Darien or Lemont. The picnic will start whenever someone arrives. The regular meeting will be in the Pavilion at 1:00 PM. If the weather is totally frightful we also have a room inside the Laboratory building available for us.

The Picnic is BYOE (Bring your own everything) If you want to eat or drink, bring it with you, as well as your BBQ or six pack.

REPAIR TIPS: RADIO SHACK SCANNER RADIOS

Copyright 1997 - 1999 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

Radio Shack has been selling scanners and monitor receivers
under the Realistic and Radio Shack labels for over 30
years. Most of them were manufactured by General Research
Electronics of Tokyo, though many newer models are
manufactured by Uniden.

The date of manufacture is usually printed on a gummed
label on the scanner as well as the cardboard box. A code
of 12A5, means the scanner was made in the 12th month of
1975, 1985, or 1995, for example.

There's another way to date Radio Shack scanners
manufactured by Uniden. The first digit of the long serial
number is usually the last digit of the year of
manufacture.

Another way to roughly estimate a radio's age is to examine
the 4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most
recent date stamp.

Schematics, Owner's Manuals, and Parts Available

I cannot furnish schematics, manuals or parts. Service manuals for most Radio Shack scanners sold through mid-1997 may be ordered through your local Radio Shack store.

If Radio Shack doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

Parts lists for recent and many older models are available on line at: http://support.tandy.com. Parts may be ordered through Tandy National Parts, telephone (800)241-8742, or through your local Radio Shack store. You may be able to obtain some technical assistance from Tandy by calling (800)843-7422, option 2. The RSU (Radio Shack Unlimited) phone number is (800)-433-2024.

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

GRE-Built Base Models: Dim Backlight

The backlight in many base models, including the PRO-2022, PRO-2004, and PRO-2005/6 is implemented by an electroluminescent panel, which grows dim with use.

The EL panel used in the PRO-2005 and PRO-2006 is designated EL-501, and is identified by Radio Shack part #10800050. A new EL panel can be ordered through your Tandy National parts (see above) or local Radio Shack store and sent to your home. Radio Shack no longer sells replacement EL panels for the PRO-2004, but Robert Cummings has modified an LCD from a Miller Engineering (http://www.microstru.com) experimenter's kit and fitted it to his PRO-2004. See http://dune.globe-net.net/~rc123/Robert/Backlight.html for details.

Replacing the backlight is an operation which requires care and patience. Purchase a service manual, and study the exploded parts diagrams as you read the following steps.

Top and bottom cabinet pieces must be removed, then the speaker unplugged from the main board. The front panel assembly must be removed from the chassis by removing 4 flat head screws, 2 on each side. You need not disconnect all the wiring harnesses, though you might have to unplug one so it won't get in the way of a hot soldering iron.

Unsolder the bare ground wire soldered to a large shield on the back of the front panel, located near the back of the squelch control. Two ground braids must be temporarily disconnected by removing the screws which fasten them to the chassis. After removing the volume and squelch knobs, you must remove 8 small screws which fasten the plastic front panel to the diplay board.

The old EL panel is fastened by a bead of glue and two foil type leads soldered to the display board. It's easier to cut the two leads from the old EL panel before unsoldering. A sharp knife should be used cut away the glue. The old EL panel can then be slid gently out from behind the LCD display.

The new EL panel can be installed by reversing the process, though I found that it is not necessary to glue the new panel. The two foil leads must be soldered using a minimum of heat. Reassemble the pieces in reverse order of disassembly.

GRE-Built Portables: Worn Out Keypads

The keypad on late model GRE-made Radio Shack portables, e.g., PRO-39 and PRO-43, can become unreliable after prolonged use. The best repair is to replace the rubber keypad instead of trying to restore contacts using chemicals. A replacement rubber keypad (PRO-43 keypad is RSU#10789808) may be ordered inexpensively through Tandy National Parts or your local Radio Shack Store.

PRO-43: Loss of Audio

Early PRO-43s were built with a 200 mW speaker (mfr's part #EAS-3P123A). The voice coils in some of these speakers have opened, resulting in lack of audio output, though audio is still available from the earphone jack. A more capable 500 mW speaker is available through Tandy as replacement (EAS-3P127).

PRO-43: Freezup

If you attempt to lock out all 20 channels in a memory bank, then scan only that bank, your PRO-43 will freeze up and be placed into a catatonic state. Use the procedure documented in the PRO-43 user manual to fully reset the scanner. This will "break the trance," but all the memory channels will be cleared.

PRO-2004: Dead

If your PRO-2004 is completely dead, check R235, a 1 ohm, 1 watt resistor mounted vertically on the main board.

PRO-7A: Channels 1 - 4 or 5 - 8 Dead

If the first or last 4 channels in your 8 channel PRO-7A
crystal scanner are not working and the lamps for those
channels won't light, replace IC4 or IC5 (type 7400A).

library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article contains product review summaries for more than
70 old and new scanner radios and monitor receivers.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. This article
describes a few of the FM receivers in my collection, and
other models I've tested. It is not meant to be complete.

You may share information with scanner collectors via the
"vintagescanners" mailing list at:

http://www.onelist.com/group/vintagescanners

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass,
Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass,
Monitoring Times, May 1995.

I have published full length reviews and modifications of
these scanner models in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT
Mar 1987 - Radio Shack PRO-2004
Oct 1990 - Radio Shack PRO-2006
Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037
Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable
Oct 1995 - AOR AR-2700 Portable
Nov 1995 - selected AOR AR-8000 measurements
Dec 1995 - Radio Shack PRO-2040
Jan 1996 - Plectron & Motorola Alert Monitors
Feb 1996 - Radio Shack PRO-2042
Mar 1996 - Tips for Fixing Bearcat Scanners
May 1996 - Compendium of Scanner IFs
Apr 1996 - Uniden/Bearcat BC220XLT, BC230XLT Portable
Jun 1996 - modifications & tips for the Uniden/Bearcat BC9000XLT
Jul 1996 - Uniden/Bearcat BCT-10 mobile
Aug 1996 - BMI Nitelogger II tape recorder activator
Sep 1996 - PRO-2022 modifications
PRO-2042 baseband audio tap
Oct 1996 - Radio Shack PRO-2046 mobile
Nov 1996 - Build a wooden mobile radio mount
Dec 1996 - AOR AR5000
Jan 1997 - ICOM R8500
Feb 1997 - Radio Shack PRO-2045
Mar 1997 - ICOM IC-R10
Apr 1997 - RELM HS-200 portable
May 1997 - Uniden/Bearcat BCT7 virtual downconversion mod.
Jun 1997 - Innovative Scanner Patents of the 1970s
Jul 1997 - Uniden/Bearcat BC235XLT portable Trunktracker
Aug 1997 - Radio Shack PRO-64 portable
Sep 1997 - Stridsberg Engineering receiver multicoupler,
G/Wiz board for EDACS trunked scanning
Oct 1997 - Radio Shack PRO-67
Nov 1997 - Sporty's JD-100 Air Scan
Dec 1997 - Uniden/Bearcat BC895XLT Trunktracker
Jan 1998 - Test Equipment Bargains
Feb 1998 - Innovative Scanner Patents of the 1980s and Beyond
Mar 1998 - RELM MS-200 mobile
Apr 1998 - RCA RP-6150 portable
May 1998 - Radio Shack PRO-2050 base Trunktracker
Jun 1998 - Opto DC442 CTCSS/DCS/DTMF display
Jul 1998 - Stub and Par Electronics intermod rejection filters

Aug 1998 - Sony SC1PC portable
Sep 1998 - Orange Book of Scanner Repair
Tone Out Testing (2-tone generators)
Monitoring ACSB (amplitude compandored side band)
Oct 1998 - AOR AR8200 portable
Nov 1998 - Alinco DJ-X10T portable
Dec 1998 - Radio Shack PRO-91 portable Trunktracker
Jan 1999 - AOR AR7000
Feb 1999 - Radio Shack PRO-2066 mobile Trunktracker
Mar 1999 - ICOM RS-8500 software for controlling the IC-R8500
Apr 1999 - ICOM IC-R2 portable scanner
Jun 1999 - Mini-Circuits ZFSC-4-1 4-way passive splitter
Jul 1999 - Racing Electronics RE2000 portable
Aug 1999 - AOR AR16 portable
Sep 1999 - Uniden Bearcat BC245XLT portable
Oct 1999 - Plectron R700 series monitor receivers
Nov 1999 - Uniden Bearcat BC278CLT clock radio scanner
Dec 1999 - Uniden Bearcat BC248CLT clock radio scanner
Jan 2000 - Radio Shack PRO-92 portable scanner
Jan 2000 - Stridsberg Engineering FLT201A FM Notch Filter and
MCA-204 Receiver Multicoupler
Feb 2000 - Yaesu VR-500 portable wide coverage receiver
Mar 2000 - Uniden Sportcat SC-200 portable scanner
Apr 2000 - Understanding Intermod, |
(comparison intermod performance of several models)|

Note: Reprints of Monitoring Times articles are available for $3.00 each plus a self-addressed stamped envelope from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this reprint fee.

ALINCO

DJ-X10T: 1998 vintage. Rugged construction - metal back. Multimode frequency coverage 0.1 to 2000 MHz (minus cellular bands). 20 selectable step sizes from 0.05 to 500 kHz. Knob atop the radio clicks when rotated and serves as a VFO knob, channel selector, and menu navigation control. Several battery pack options for NiCd and alkaline battery cases. Furnished with an EBP-37N 4.8 V, 700 mAH NiCd pack and a sturdy 11 hour drop in charging stand. Loaded with firmware features and complicated to use. Two VFOs and 1200 channels in 30 banks of 40 channels each. Memory banks are cryptically designated, though you can scan combinations of banks. Each memory channel can be programmed with the frequency, an 8 character label, attenuator, a skip (lockout) flag, and mode (WFM, NFM, AM, USB, LSB, CW, AUTO). Very slow 6 ch/sec scan rate. Rescan delay is about 1 second and cannot be disabled or changed. Auto Memory Write stores up to 40 frequencies but does not check for dupes.

20 linkable search banks with labels. Up to 50 frequencies per search bank can be locked out. Digital clock with on/off timer. Battery saver can be disabled. Ability to scan or search for signals above a selectable threshold or channels with a specific mode. Band scope 7 or 40 steps wide. In short, 30 - 1000 MHz sensitivity is good, few birdies and little intermod. WFM broadcast reception very good. The DJ-X10T squelch can be set to one of 10 levels. We had to keep the squelch set to SQ3 or higher, otherwise it opens at inappropriate times, especially when the battery saver is active. The DJ-X10T instruction manual does not specify the IF (intermediate frequency) scheme. Filters inside the DJ-X10T imply 0.455, 10.7, and 45 MHz IFs. Our tests indicate a first IF of 736.25 or 275.45 MHz, depending on the frequency to which the DJ-X10T is tuned. Our DJ-X10T hears images of cellular phone signals clearly in the 1419.9 - 1444.9 MHz range, 550.9 MHz above their actual frequency. For a full review, including technical test results, see Monitoring Times, November 1998.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

AR5000: 1996 vintage. approx. 30 kHz - 2600 MHz coverage super receiver. Good sensitivity throughout. AM, SSB, CW, FM detectors. Frequency readout to 1 Hz. More features than any other radio. DTMF reader and RS-232 interface included. Multiple settings for IF and AF selectivity, attenuator, AGC, deemphasis, etc. DB9 RS232C connector. Negatives include low contrast LCD display and difficult user interface. NFM squelch closes slowly, causing noise burst at end of each NFM transmission. Electromechanical relays click at various frequency boundaries, including 400 MHz, producing a clickety-clack noise -- annoying while scanning banks of mixed band frequencies. Great radio, otherwise. See "AOR's AR5000 All-in-One Receiver," by Bob Parnass, in Monitoring Times, December 1996, for a review which includes quantitative test results.

AR8200: 1998 vintage. S/N 550004 tested. Portable, high end "super" scanner covers 0.1 - 2040 MHz (minus cellular in USA version). Not a scanner for beginners. Many of the settings are made through the use of menus. Lots of features. 4 AA batteries, steel belt clip, plug-in AM antenna. 1,000 conventional channels in 20 banks, 10 temporary channels, one priority channel. Each memory channel may be programmed with frequency, label, mode, step, step-adjust, offset, attenuator enable, noise limiter, AFC, and write protect. Multi bank scanning. You can enable a 0 - 9 second rescan delay with each scan group, but not per channel. 40 pairs of search limits with labels. Offset capability for monitoring repeater input frequency. LCD display easy to read. Display and keypad backlit using green LEDs. The band scope. Shortwave reception stone deaf on shortwave when fitted with the supplied antenna or a 19" whip. Seriously overloaded on shortwave by a 132 foot long dipole unless we use the built-in attenuator. Supplied "dorsal fin" antenna for AM BCB. Scans slowly (14 channels/s). Requires more current. Audio quality is slightly above other portable scanners. Computer port. One slot for a single plug-in option: voice inversion descrambler, CTCSS search, 256 frequency tone eliminator, voice recorder and playback, or extended (slow) memory. See AOR AR8200 review by Bob Parnass,in Monitoring Times, October 1998, for review with quantitative test results.

ICOM

IC-R10: late 1996 vintage (serial number 01048 tested). Shirt pocket size multimode is powered by 4 AA penlight cells. Covers 0.5 to 1300 MHz (minus cellular). NFM, WFM, USB, LSB, AM, and CW detectors included. IF bandwidths are fixed. No 30 kHz bandwidth for satellite or FM military monitoring. Battery saver circuit, with selectable duty cycle. Single VFO and 1000 memory channels. There are 900 memory channels divided into 18 banks of 50 channels each. Another bank of 100 channels used to hold unique frequencies found during an auto store operation. 20 pairs of search limits. Up to 100 frequencies may be locked out during a search and stored in a final bank of 100 channels which is cleared before subsequent auto store searches. Each channel can be programmed with the detector mode (e.g., AM, USB), a tuning step size, an attenuator enable flag, and an 8 character label. CI-V computer interface requires extra cost hardware. 7 segment S-meter. Noise blanker. Good sensitivity. Lighted keypad and display, but keystroke sequences are cumbersome.

Good radio hardware in a handy sized package, but scanning performance unimpressive. Very slow memory scanning at only 6 channels/second. Searches at about 16 steps/second, with

little or no worthwhile improvement using the "Signal Navigator" feature in the R10 I tested. Rescan delay cannot be disabled. Can only scan one memory bank or all banks, not a combination of banks. No squelch for SSB or CW modes. See "ICOM IC-R10 Receiver," by Bob Parnass, in Monitoring Times, March 1997, for review which includes quantitative test results.

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the ICOM user with a very annoying clickety-clack, clickety-clack! For Baseband Audio out, I mounted an RCA jack on the back of the R7100A and connected it via shielded cable to the junction of resistors R228 and R230 on the Main Unit. This point is located in the vicinity of IC15 and X3 on the

schematic.

R8500: 1996 vintage. 100 kHz - 2000 MHz coverage. 20 banks of 40 channels although bank sizes can be changed. 100 Auto store and 100 Skip memories but that can be increased by reallocating channels from the conventional scan banks. Fixed and programmable step sizes. Relays clickey-clack while scanning across band boundaries. Triple conversion, First IF is 48.8, 778.7, or 266.7 MHz, depending on band. Second and third IFs are 10.7 and 0.455 MHz. Weak to moderate cellular images starting near 1106 MHz. Rugged construction. External power supply. DB25 RS232C connector. Audio peak filter. Ok scanning and great searching performance. See "ICOM R8500 Receiver," by Bob Parnass, in Monitoring Times, January 1997, for a review which includes quantitative test results.

UNIDEN/BEARCAT AND ELECTRA/BEARCAT

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel

interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout. See US patents 4,092,594, granted 5/30/78 and 4,114,103, granted 9/12/78 for further insight.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. See US patent 4,270,217, granted May 26, 1981. LED readout. Good scanner, but tinny audio.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1996.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC230XLT (Uniden): See BC220XLT.

BC235XLT TrunkTracker(Uniden): 1997 vintage. Portable with 300 channels in 10 banks. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. A query feature identifies duplicate memory channels. Very fast scan and search rates. Scans 64 channels/sec and skips empty channels. Service search. Data skip. Triple conversion, 254.4, 10.85, 0.45 MHz IFs. Excellent image rejection and intermod immunity. Fairly good audio. See "The Uniden Bearcat BC235XLT," by Bob Parnass, AJ9S, in Monitoring Times, July 1997 or an on-line version at http://www.grove-ent.com for a review which includes quantitative test results.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen,

police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels See US patent 4,270,217, granted May 26, 1981. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite. See US patent 4,409,688, granted 11/11/83 for further insight.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC895XLT TrunkTracker(Uniden): 1997 vintage. Base with 300 channels in 10 banks. Covers military air band, but other frequency coverage is limited compared with the BC9000XLT. Predetermined AM and NFM modes not selectable. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. Weather alert siren. Built-in CTCSS decoder and tone finder. A query feature identifies duplicate memory channels. Test unit scans 85 channels/sec and skips empty channels. Triple conversion, 380.8 or 254.4, 10.85, and 0.45 MHz IFs. 800 MHz images in commercial and military air bands attenuated over 35 dB. For technical test results and a review, see "The Uniden Bearcat BC895XLT," by Bob Parnass, AJ9S, in Monitoring Times, December 1997.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob.

Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. For a full review, see "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times. See US patents 4,947,456, granted 8/7/90, 5,163,161, granted 11/10/92 and 5,212,817, granted 5/18/93 for further insights into fast scanning and searching implementation.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. NiCd pack provides about 5 hours between charges. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

REGENCY

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging

capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. See US patent 4,057,760, granted 11/8/77. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Z60: base/mobile sporting 60 channels, but 10 of them are for FM broadcast only. Built in alarm clock, priority, and memory which requires no battery backup. Covers 30 - 50, 88 -108, 118-136, 144-174, 440-512 MHz. Notice that it's not spec'd to cover some important federal bands: 136 - 144 and 406 - 440.

RCA

RP-6150: 1997 vintage. No frills, good performing portable. 200 channels in 10 banks. No military aircraft frequency coverage. Triple conversion and a flexible battery arrangement. Lacks duplicate channel detection, search skip, and empty channel lockout features of newer designs. Our sample isn't super sensitive at 470 - 512 MHz and has some intermod around the VHF railroad channels but is generally more resistant to image problems than the BC230XLT. For technical test results and a review, see "The RCA RP-6150 Portable," by Bob Parnass, AJ9S, in Monitoring

Times, April 1998.

RELM

HS200: 1996 vintage. Very good 200 channel portable. 10 banks. Built-in CTCSS and DCS decoder. Lighted keypad. Duplicate channel detection. 100 frequencies can be locked out from search. Very good audio and strong front end. Excellent internal shielding. Global rescan delay. Covers CB. Fixed modes and step sizes. IFs are 280.2 and 0.45 MHz, and perhaps one in between. See "The RELM HS-200 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1997, for a review which includes quantitative test results.

MS200: 1998 vintage. Made in USA. 200 channel mobile with alpha labels. CTCSS and DCS decoding squelch. Programmable via PC using supplied software. Low contrast, LCD display. Keypad backlit for night programming. Rear panel tape audio jack. Test unit had lots of intermod on VHF-high band. IFs are 280 and 0.45 MHz. See "The RELM MS-200 Scanner," by Bob Parnass, AJ9S, in Monitoring Times, March 1998, for a review which includes quantitative test results.

RADIO SHACK

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

PRO-26: 1995 vintage. (Not to be confused with a simple 1985 crystal controlled portable bearing the same model number.) Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn

on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range. IF frequencies are specified at 608.005 - 611.2 MHz, 48.5 MHz, and 455 kHz.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-62: 1994 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO-64: 1997 vintage. Good portable 400 channel scanner using up conversion. Replaces PRO-62 and has many more features. Selectable AM/NFM modes but fixed step sizes. 10 search banks which can be cascaded. Auto store saves unique frequencies found during a search. Frequencies can be loaded using a computer but optional interface kit not yet available. Can recharge Radio Shack's optional, monolithic NiCd pack, but not AA cells within the scanner. IFs are 257.5, 21.4, and 0.455 MHz. See "The Radio Shack PRO-64," by Bob Parnass, AJ9S, in Monitoring Times, August 1997, for a review which includes quantitative test results.

PRO-67: 1997 vintage. Good portable 200 channel scanner using up conversion. Replaces PRO-51 and has better image rejection and super fast scanning. Service Search lacks police frequencies. Fixed AM/NFM modes and step sizes. Can lock out up to 20 frequencies during a search. Can recharge AA cells within the scanner. Frequencies adjacent to the cellular phone bands censored so our PRO-67 will not receive 868.9625 or 823.9625 MHz. Intermediate Frequencies are 254.4, 10.85, and 0.45 MHz. See "The Radio Shack PRO-67," by Bob Parnass, AJ9S, in Monitoring Times, October 1997, for a review which includes quantitative test results.

PRO-91: 1998 vintage. Portable made by Uniden for Radio Shack. 150 channels in 5 banks. Can selectively follow conversations in 800 MHz Motorola trunked radio systems. Censors 823.975 - 823.95 and 894.0125 - 896.1 MHz covered by the BC235XLT. Powered by four individual AA alkaline or NiCd batteries. Power save feature. Program key. One priority channel/bank. One search bank. Direct search. Service search omits many police freqs (inc. 460 - 460.5 MHz). While connected to an outdoor antenna, our PRO-91 experiences intermodulation interference in the 161 MHz range from a paging transmitter on 158.1 MHz. IFs near 380.7, 10.85 and 0.450 MHz. See PRO-91 review by Bob Parnass, in Monitoring Times, December 1998, for review with quantitative test results.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft.

Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Somewhat prone to intermod in the 460 MHz range. Cellular images throughout the 847.6 - 869 MHz range. See September 1996 Monitoring Times for modifications.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 -

612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-2045: 1996 vintage. Very good 200 channel base/mobile made for Radio Shack by Uniden. Tuning/channel selector knob. 10 banks, selectable attenuator, and rescan delay. CTCSS-capable with optional board. Great Auto Store. Weather alert. Scans and searches fast. Can lock out 50 frequencies during search. Step sizes fixed but AM and NFM modes are selectable. IFs are 380.7, 10.7, and 0.455 MHz. Images on VHF-high band despite high 1st IF. Some intermod on review unit. See "The Radio Shack PRO-2045," by Bob Parnass, AJ9S, in Monitoring Times, February 1997, for a review which includes quantitative test results.

PRO-2046: 1996 vintage 100 channel mobile made by Uniden with fairly good performance. Descendent of the BC760XLT but no CTCSS option available. Ten banks of ten channels. Scans memory at about 34 channels/sec. Service search, direct search, and band search. Preset search limits by band and user cannot program the search limits. Image rejection is minimal, as one would expect from a scanner with IFs of 10.85 and 0.450 MHz. 10 Monitor memory channels. Can lock out up to 20 channels from a search. See "The Radio Shack PRO-2046," by Bob Parnass, AJ9S, in Monitoring Times, October 1996, for a review which includes quantitative test results.

PRO-2050: 1998 vintage 300 channel Motorola trunk system tracking base made by Uniden. Tight front end. Excellent performance. Chassis-less, plastic construction. Squelch and volume knobs too close and Manual key is hard to find. IFs are 380.7 (approx.), 10.85, and 0.45 MHz. AM and NFM modes are factory set and not selectable. 300 channels in 10 banks and a 2 second rescan delay may be programmed on a per channel basis. Query feature identifies duplicate memory channels. Our PRO-2050 scans at 78 channels/sec., skipping over empty channels. 10 priority channels. Up to 50 frequencies may be locked out from limit search. A single pair of limits may be programmed for a limit search. No Direct key or direct search facility. Factory preprogrammed frequencies for police, fire/emergency, commercial air, public service, and weather, but not marine. See May 1998 Monitoring Times for a review which includes quantitative test results.

SONY

SC1PC: 1998 vintage. Good RF and audio performance. Covers 25 - 1300 MHz, minus cellular phone. Selectable step size

and mode. Computer control and downloading with software and PC cable provided. Powered by ordinary AA batteries. Provided CDROM includes both the scanner control program and the multi million record PerCon FCC license database. 10 banks ("pages" in SONY parlance) of 30 channels each. Per-channel 2 second rescan delay. Unlike the ICOM IC-R10, you can scan any combination of memory banks. You can lock out ("skip") memory channels from scanning. The frequency stored in a skipped channel will also be skipped during searches. One priority channel checked every 5 seconds. SONY's limit search is restricted to one pair of search limits, though computer control expands this to 20 linkable pairs. Band search lets you search through 17 bands programmed at the factory. Service search. A cache, termed Intelligent Memory, stores the last 10 unique frequencies that were active for longer than 5 seconds each. IFs (in MHz) are 600 (below 370 MHz), 232.5 (above 370 MHz), 45.0, and 0.455. See "The SONY SC1PC," by Bob Parnass, AJ9S, in Monitoring Times, August 1998, for a review which includes quantitative test results.

SPORTYS

JD-100: 1997 vintage. Limited 20 channel scanner which covers civil and military air bands only. Good audio. Large display shows frequency only out to 2 digits. Slow scanning and odd keystroke sequences. No key press confirmation beep. Cannot lock out channels from memory scan. Powered by AA batteries. Battery saver circuit. See "Sportys JD-100 Air Scan," by Bob Parnass, AJ9S, in Monitoring Times, November 1997.

CRAIG (division of PIONEER)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

SONAR

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X			no
FR105	6	X			no
FR2512	24	X			no
FR2513	24	X			no
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2516	10	X		yes	yes
FR2517	10	X		yes	yes
FR2525	10	X		yes	yes
FR2526	10	X	X	yes	yes
FR2527	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

TENNELEC

Manufactured the first synthesized scanners. See US patents 3,961,261 and 3,962,644, granted 6/1/76 and 6/8/76 respectively. Company went out of business several years

ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes and extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

How to Obtain Copies of Patents

Printed copies of US patents may be purchased for $3 each, but you must know the patent number. Credit card orders are taken over the telephone by the Assistant Commissioner for Patents at (703)305-4350. Alternatively, you can mail a check or money order, made payable to "The Assistant Commissioner for Patents" to

The Assistant Commissioner for Patents
Washington, DC 20231

For more information about the US Patent and Trademark Office, call their automated information message system toll-free at (800)786-9199.

There are various patent servers on the world wide web, including IBM's server:

HAMFEST/COMPUTERFEST CALENDAR 2000 - ILLINOIS
last updated March 27, 2000 |

o Please report additions or changes to Bob Parnass, AJ9S, office phone: (630)979-5414, electronic mail: parnass@bell-labs.com. Thanks to Dennis Dale, Rick D. Wilson, John Wass KA9QJX, Tom Harker, and ARRL for providing some of the information.

APRIL 2000

Apr 2 (Sun): Wheaton, IL - Giant Computer Show & Sale (see | below). DuPage County Fairgrounds, County Farm Rd. & Man- | chester Rd. 9:30 AM - 3 PM. Adults $6, children $2. |

Apr 7-8 (Fri, Sat.): Milwaukee, IL - AES Superfest at AES Milwaukee store, 5710 W. Good Hope Rd. 2PM-7PM. (Fri.), 8:30AM-4PM (Sat.) 35 manufacturers. Free Admission, manufacturers reps, flea market, forums, as well as store specials and closeouts. Also Radio Recyclers next to AES. For further info call Ray at (414) 358-4088, email at raykhk9w@aol.com or check out the Web site at http://www.aes/jam.com

Apr 9 (Sun) - Stoughton, WI - Madison Swapfest. Mandt Commumity Center, Stoughton Junior Fair Grounds, Stoughton WI. Doors open at 8AM. Tickets $5. talk-in on 147.15 repeater. Info: write to (SASE) MARA, Box 8890, Madison, WI 53708-8890. Swapfest Info Line (608) 245-8890 24 hrs/day. http://www.qsl.net/mara

Apr 15 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Apr 16 (Sun): Orland Park, IL - Giant Computer Show & Sale | (see below). Orland Park Civic Center, 147th St. & Lagrange | Rd. 9:30 AM - 3 PM. Adults $6, children $2. |

Apr 29 (Sat): Stickney, IL - DuPage ARC. Hawthorne Race Course, 3500 S. Cicero Ave. Admission $6. Talk-in 145.25 repeater. http://www.w9dup.org, Info: Ed Weinstein, WD9AYR, 7511 Walnut Avenue, Woodridge, IL 60517. Phone: 630-985-9256. Email: DARCHamfest@aol.com,

Apr 30 (Sun): Arthur, IL - Moultrie ARK. Info: Ralph Zancha, WC9V, PO Box 55, Lovington, IL 61937. Phone: 217-873-5287. Email: rzancha@one-eleven.net

Apr 30 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

Apr 30 (Sun): Galva, IL - W9YPS Hamfest, Area Amateur Radio Operators club. Galva National Guard Armory. Morgan Rd. Admission $5. Info: Phil IMes, WD9IRE, kewphil@cin.net or Bill Anderson WA9BA, bill@inw.net

MAY 2000

May 6 (Sat) - Cedarburg, WI - Ozaukee RC Hamfest, Circle B Recreation Center (St. Hwy 60 and Ozaukee Cty I) Admission $4. VEC Exams 9AM-Noon. Info: AA9HR (262)377-2137 (6PM-8PM), email aa9hr@execpc.com or write O.R.C. Swapfest Committee, 1702 Holly Lane, Grafton, WI 53024

May 7 (Sun) - Sandwich, IL - DeKalb Hamfest; Sandwich Fairgrounds (intersection of Suydam and Gletty roads). 8AM - 1PM, admission - $6.00, 2 indoor buildings. No VEC testing. Talk-in on 146.730/- or 146.520. Info: W9ICU at (815)895-3219, email W9ICU@tbcnet.com. http://tbcnet.com/~jleonard/hamfest.htm

May 13 (Sat): Manitowoc, WI - Lakeshore Hamfest, Mancorad RC. Manitowoc County Expo Center, intersection of HWYS 42-15 and I-43 on County R. Starts 8AM. VEC exams at Silver Lake College, Hwy 151 West (regestration closes at 9 AM). Admission $5. Talk-in 146.61/-. Info: Red (920)684-3733 or Fred (920)682-9264. Mancorad Radio Club, P.O. Box 204, Manitowoc, WI 54221-0204.

May 19-21 (Fri-Sun): Dayton, Ohio - Dayton Hamvention; Hara Arena. Admission $22 (advance - $16) for three days; talk-in on 146.94/- , 146.91/-. Biggest hamfest in USA. Info: call (937)276-6934 or write Hamvention, Box 964, Dayton, OH 45401-0964. Email: info@hamvention.org or see web page http://www.hamvention.org

May 20 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

May 21 (Sun): Wheaton, IL - Giant Computer Show & Sale (see below). DuPage County Fairgrounds, County Farm Rd. & Manchester Rd. 9:30 AM - 3 PM. Adults $6, children $2.

May 28 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College

Rd. 9:30 AM - 3 PM. Admission $6, children $2.

JUNE 2000

Jun 4 (Sun): Princeton - IL Starved Rock RC. Bureau County Fairgrounds. Exit 56 from I-80. Admission $7 (ouch!) at gate. Talk-in 146.955, -600, PL103.5 Hz. info: AL Erbrederis, tel. 1-815-498-9675, 262 Easy St., Somanauk IL.60552. ERB.N9PIB@juno.com. http://www.qsl.net/w9mks. E-mail: w9mks@qsl.net. (Usually an excellent hamfest. Unlimited space outdoor flea market, some indoor space, though few big name commercial vendors. Crude restroom facilities. - AJ9S)

Jun 11 (Sun): Wheaton, IL - Six Meter Club of Chicago. http://cyberconnect.com/orion/smcc.html. Info: Joseph Gutwein, WA9RIJ, 7109 Blackburn Avenue, Downers Grove, IL 60516-3925. Tel: 630-963-4922 or 708-442-4961 . Email: wa9rij@mc.net

Jun 24 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Jun 25 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

JULY 2000

Jul 8 (Sat): Oak Creek, WI - South Milwaukee ARC. American Legion Post 434, 9327 South Shepard Ave. Admission $5. Talk-in 146.52 MHz. Info, call (414)762-3235.

Jul 9 (Sun): Peotone, IL - Kankakee Area Radio Society, Will County Fairgrounds. I-57 to Peotone exist 327 (East). Free parking. Talk-in 146.94 MHz. http://www.w9az.com. Admission $5. Info: Don Kerouac, K9NR, 6311 East Flora St., Kankakee, IL 60901. Tel: 815-939-7548. Email: k9nr@juno.com

Jul 15 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Jul 23 (Sun): Sugar Grove, IL - Fox River Radio League. Waubonsee Community College. Admission $5. http://www.frrl.org/hamfest.html Info: Maurice Schietecatte, W9CEO, 813 Cindy Lane, Sandwich, IL 60548. Tel: 815-786-2860. Email: w9ceo@arrl.net (good, small to midsized hamfest. Easy parking. Modern restroom facilities. - AJ9S)

AUGUST 2000

Aug 12 (Sat): Quincy, IL - Western Illinois ARC. http://www.qsl.net/w9awe. Info: Jim Funk, N9JF, PO Box 3132, Quincy, IL 62305-3132. Tel: 217-336-4191 . Email: jfunk@adams.net

Aug 13 (Sun): Peotone, IL - 66th Annual Hamfesters Hamfest. Will County Fairgrounds. 45 mintues from Downtown Chicago, take I-57 to Peotone Exut 327 (East). 35 acres of free parking. 14,200 square feet of exhibits open at 8 AM. Flea market open at 6 AM to 3 PM. No additional charge for flea market space. Rain or shine -six covered pavilions for Flea Market. Tickets are $4.00 in advance with double stub, $5.00 at gate with single stub. Children under 12 free. Advance ticket sales and information: SASE and check by July 25th, Christine Mack, PO Box 2161, Oak Park, IL 60303. tel. 708-358-1786, email: christine1@mediaone.net. Talk in on 146.52 simplex and 146.64-(107.2) Stars Repeater

Aug 19 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Aug 27 (Sun): Danville, IL - Vermilion County ARA. Info: Gary Denison, KA9SKS, 14704 East 2750 North Road, Danville, IL 61834-5610. Tel: 217-759-7389 . Email: gdenison@danville.net

Aug 27 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

SEPTEMBER 2000

Sep 16 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Sep 16 & 17 (Sat & Sun): Peoria, IL - Peoria Area ARC. Info: Ron Morgan, KB9NW, or John Coker, N9FAM, both c/o: PO Box 3508, Peoria, IL 61612-3508. tel: (309)692-3378. Email kb9nw@juno.com or n9fam@juno.com. http://www.peoriasuperfest.com

Sep 23 & 24 (Sat & Sun): Grayslake, IL - Chicago FM Club Radio Expo. Lake County Fairgrounds. http://www.chicagofmclub.org. Admission $8, good both days. Info: Mike Brost, WA9FTS, 5127 North Monterey Avenue, Norridge, IL 60706. Tel: 708-457-0966, Email: mbrost@cin.net (the biggest and best hamfest in northern IL - AJ9S)

Sep 24 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College

Rd. 9:30 AM - 3 PM. Admission $6, children $2.

OCTOBER 2000

Oct 14 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Oct 22 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

NOVEMBER 2000

Nov 5 (Sun): Davenport, IA - Davenport Radio Club. Iowa National Guard Hanger, Mt. Joy Airport. Talk-in 146.88 MHz repeater. http://www.gwltd.com/hamfest

Nov 18 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Nov 18, 19 (Sat, Sun): Ft. Wayne, IN Fort Wayne Hamfest & Computer Expo. Allen County Amateur Radio Technical Society. 2000 Indiana ARRL State Convention. Allen County War Memorial Coliseum Exposition Center. Hours 9 AM - 4 PM EST Sat, 9 AM - 3 PM EST Sun. Admission $5 plus $2 parking. http://www.acarts.com

Nov 26 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

DECEMBER 2000

Dec 16 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

COMPUTER SHOW NOTES

Computer Central computer shows are held at the College of DuPage, Main Arena of the Physical Education Building Park Blvd & College Road, Glen Ellyn, Il. 847-940-7547. $5 admission with card, normal admission $6.00. Opens 9:30 am - 3:00 pm. See http://www.computercentralshows.com web site.

Giant Computer shows are held by Micro Media, Inc. Shows are usually held at the Orland Park Civic Center, 147th St. & LaGrange Rd., Orland Park, IL or at the DuPage County

Fairgrounds, County Farm & Manchester Rds., Wheaton, IL.
Admission is $6. Show hours are 9:30 AM - 3 PM. To get on
the mailing list or get more information, call (708)974-
3123. See http://www.giantcomputershow.com

Computer Country Expo is Lake County's largest computer
expo. The event is held on designated Saturdays from 9:30
AM to 3:00 PM. This show features computers, supplies,
games, parts, software, accessories, CD-ROM, monitors,
diskettes, printers, keyboards, modems, disk drives, cables,
expansion boards, services, etc. Lake County Fairgrounds,
Route 120 (Belvidere Rd.) & Route 45, in Main Exhibit Hall
Building #1=9720,000 sq. feet. For a show map, exhibitor
info, and discount coupon, visit the web site at
http://www.ccxpo.com.

Why bitch about one person when there are twelve (12) for sale right now by MANY sellers?

You should worry more that someone might report any illegal activities that you may or may not be doing as they are constantly watching you.

What price do you think that they should be sold on eBay? Maybe $90 so that the seller looses around $20 counting the price of the scanner, shipping and eBay fees.

BTW don't ever buy a diamond or jewelry. The sellers make 300% profit on those items even after they give you a 50% discount!

Hi Glenn,
Many thanks to you and the group for your assistance. Bill took his web site off line a while back, when he announced his medical concerns. I did manage to hook up with another newsgroup participant, who is sending along some assistance.

It is interesting that you would post this question, as I spent all day Thursday web searching just that. Type in "trunk tracking II" and see what pops up. I found some excellent reviews. The bottom line was that I went with the Optoelectronics unit.

If I've said it once, I've said it a thousand times, if you want to have a
private conversation, keep your waves out of my body!
Any radio waves caught invading my personal human body WILL BECOME MY
PERSONAL PROPERTY! After all it is giving me cancer.
>
> For example, using a scanner to listen to cordless telephone
> conversations is not only a bit sick, it is also the ethical equivalent

No one tapped your phone, you chose to blast your message out into the open,
not me. Use your wired phone if you want to be private.
And thanks for dropping in to a newsgroup to enlighten the little people.
You can go back to ripping the wings off flys now, if your mama doesn't
catch you!
Are you constipated, or just an asshole?

You have 50 channels you can program already, that's pretty good for what
the 350 costs. I suggest if you need more you sell the scanner on ebay.com
and buy a different model.

The price should be about $90 to $100 if it is cell capable, which indeed it may be, depend upon the date of manufacture, see:

Here is a list of the pre-ban scanners of which I am

aware that should be capable of frequency restoration:

PRO-2004 BC-855XLT *3 Regency 4030

PRO-2005 BC-200XLT Regency 1600

PRO-2006 BC-205XLT Icom IC-R10 *7

PRO-2022 BC-760XLT *4

PRO-2026 *8 BC-700A *3

PRO-2027 BC-890XLT *4

PRO-2030 BC-950XLT

PRO-2032 BC-2500XLT *3

PRO-34

PRO-37

PRO-39

PRO-43 *1

PRO-46 *2 *5

PRO-51 *6

PRO-23 *6

Note 1: Date code of 2A4 (Feb94) and prior, any xA3, any xA2 (label in battery
compartment), or no "A" in the serial no. (Date code 3A4 (Mar94) and after WILL
NOT WORK !)

Note 2: Date code of 2A4 (Feb94) and prior, any xA3, any xA2 (label on back).

Note 3: Date of mfg code must not end in the letters "ID" or after. (ID=94), except for OAID (Jan94). (On BC700A some "OBID" (Feb94) work)

Note 4: Date of mfg code must not end in the letters "ID" or after. (ID=94)

Note 5: Units with date code of 5A4 (May94) can tune the restored
frequencies
in 30 kHz Steps using a keyboard entry sequence after a wire on the "newly
attached" daughter board is snipped.

Note 6: Units with date code of 6A4 (Jun94) and prior (and some 7A4) can
tune
the restored frequencies in 30 kHz Steps using a keyboard entry sequence.
After
date code 7A4 (Jul94) no mod can be done.

Note 7: The current 1998 models are. New reports say Icom is now only
importing non-modifiable versions.

Note 8: Model (catalog) number with "B" at the end not modifiable. (Reported
no
L201 jumper on the circuit board)

The below list are those scanners that were capable of receiving the full
800
MHz band,

without modification:

J.I.L. SX-400 AOR-950 Icom R-7100 *

Regency MX-4000 AOR-1000 Icom R-1*

Regency MX-5000 AOR-1500 Icom R-100

Kenwood RZ-1 AOR-2500 Icom R-9000

Uniden BC-800XLT AOR-3000 * Icom R-7000

Yaesu FRG-9600 AOR-8000 *

* pre-1994

I believe the term "ghosting" refers to programming one scanner by
connecting it to a second scanner where the second scanner has already
been programmed. This results in two identical (ghosted) radios.

Receiving signals on frequencies other than the ones the signal belongs on
is the result of frequency "mixing" within the receiver.

Here we go again! The Cellular Telecommunications Industry Association (CTIA) strongly supports the Wireless Eavesdropping Protection Act of 2000, introduced March 29, 2000 by U.S. Senators Ron Wyden (Oregon) and Conrad Burns (Montana)of the 106th Congress. It bans scanners regardless of what type of technology is used.

http://thomas.loc.gov/cgi-bin/bdquery/z?d106:s.2326:

S.2326 : A bill to amend the Communications Act of 1934 to strengthen and clarify prohibitions on electronic
eavesdropping, and for other purposes.
Sponsor: Sen Wyden, Ron - Latest Major Action: 3/29/2000 Referred to the Senate Commerce, Science, and Transportation

Here is another older bill(H.R.3489)from the House of the 106th Congress anti-scanner members.
12/14/1999: Referred to the Subcommittee on Telecommunications, Trade, and Consumer Protection.

http://thomas.loc.gov/cgi-bin/bdquery/z?d106:h.r.03489:

And another older anti-scanner bill that has not died (H.R.514).

http://thomas.loc.gov/cgi-bin/bdquery/z?d106:h.r.0514:

I think they have gone nuts. It really is about covering censorship being forced on you by the bogus phrase of eavesdropping protection. Wireless business, money, and lawmakers and you pay the price for airtime and the hidden price of lost freedom. Restricted airwave monitoring laws helped insure the growth Nazi Germany before World War II.

FCC License Data Sources
Bill McFadden
billmc@agora.rdrop.com

Changes preceeded by "|". Please e-mail corrections and additions to me.

INTRODUCTION

This is a list of FCC license data sources available to scanner hobbyists. The FCC master contains a wealth of data about every non-federal-government license in the United States (over three million records). Many of the sources listed contain a subset of this data, although some contain all or nearly all of it. Federal government licenses are not administered by the FCC, and the data is not available to the public.

Also available are subscription services from companies like ISI and CET. Since they charge by the minute, they are not really practical for the hobbyist and hence are not included in this list.

Prices are rounded to the nearest dollar and include shipping, if known.

Another listing of FCC databases has been compiled by Rich Wells at:
http://www.strongsignals.net/htm/fccfrqdb.htm

----- WEB-SEARCHABLE DATABASES -----

You can search the FCC master for free from these web sites:

| https://haifoss.fcc.gov/beta/genmen/index.hts

http://www.perconcorp.com/db_srch.htm

----- DOWNLOADABLE DATABASES -----

SCANWARE ASSOCIATES

ScanWare Associates has developed a PC-based database program called the FCC Frequency Retrieval System. FCC data for all states is available, covering all services and all frequencies. However, it is not being updated frequently.

Scanware has chosen to discontinue developing this software, but the good news is that the software and data are now FREE! It is being hosted by the West Virginia Educational Network. See:
| http://ednet.wvsc.edu/~fcc

----- PURCHASABLE DATA -----

BETTY BEARCAT

The Bearcat Radio Club sells FCC data in several forms. The Betty Bearcat series of regional directories covers US public service frequencies in 8 volumes. Also available is the Betty Bearcat CD-ROM that contains public service data for the entire US and a DOS-based database search program.

Betty Bearcat directories are $17 each, and the CD-ROM is $27. They are available from The Hobby Radio Stop at 937-299-6440 (info), 800-423-1331 (orders), or http://www.bearcat1.com/scanners.htm.

C.E.T.

CET sells records of all stations inside a 30-mile radius for $80. (Major cities cost extra.) A 70-mile search costs $178. The data is provided on floppy disks and is available in ASCII columnar and comma-delimited formats.

CET does not provide data for licenses that do not contain specific geographic coordinates (i.e., mobile-only systems) or specific operating frequencies (e.g., amateur radio).

To do the search, CET requires the latitude and longitude of the center of the 30-mile radius. I calculated mine from a USGS topographic map I obtained at a local nautical supply store. Alternatively, you can obtain the coordinates for your town from the US Census Bureau at http://www.census.gov/cgi-bin/gazetteer/. For my area, the server returned the coordinates of the main post office.

CET can be reached at 800-445-0297.

CSP TECHNOLOGIES

CSP Technologies sells FCC data on CD-ROM. ScannerBase covers the entire US and comes with a database search program.

ScannerBase used to cost $34 but is now being sold for $4 a copy while supplies last! In addition, the newest version, Scannerbase XE, is available for free download from CSP's web site. CSP Technologies can be reached at 888-857-4240 (voice) or http://www.csp-tech.com/.

GROVE

Grove sells FCC data on CD-ROM and floppy. The CD-ROM covers the entire US and is available with or without mapping support. The mapping version brings up a map with the requested station plotted on it. The regular version is $104, and the mapping version is $174.

Floppies are available by state for $44 per state (add $10 for CA, FL, TX). The disk comes with a database search program. Grove Enterprises can be reached at 800-438-8155 (voice) or http://www.grove.net/.

MR. SCANNER

Mr. Scanner offers custom printouts of public service frequencies by county, or the entire FCC master for a city or town. Also available is public service data on floppy disk and a CD-ROM of all FCC data for the entire US. The floppy disks and CD-ROM come with a database search program.

County printouts are $4 each, and city printouts are $6 each. Floppies are $25 for the first state, and $10 for each additional state. The CD-ROM is $37. They are available from The Hobby Radio Stop at 937-299-6440 (info), 800-423-1331 (orders), http://www.bearcat1.com/mrscan.htm (printouts), or http://www.bearcat1.com/menu09.htm (disks).

PERCON

PerCon sells FCC data on CD-ROM. The Spectrum CD covers the entire US and comes with a simple database search program. Regional CDs cover subsets of the US but come with a more powerful database manager and provide more detail about each license. Also available is a Ham callsign and repeater database CD.

Spectrum costs $37, and the Ham and Repeater Database is $22. Regional CDs are $137 for the first CD, $102 each additional CD ($560 for the entire 6 CD set). Data is updated twice a year. PerCon can be reached at 716-386-6015 (voice), 716-386-6013 (fax), support@perconcorp.com, or http://www.perconcorp.com. The Spectrum database can be searched free of charge via Percon's WWW page.

POLICE CALL

This is probably the most cost-effective source of public service license information. The detail is limited, but the information that is there is often more useful than the FCC master. For example, an entry in Police Call that reads, "Portland Police, Net 3, North Precinct," reads, "Portland, City of" in the master. Police Call has been merged with its sister publication, Beyond Police Call, and now includes a limited selection of business listings.

Police call is available in 9 volumes covering different regions of the US. It can be purchased at Radio Shack stores for $13 per volume.

PRO DATA

Pro Data is a database manager program for license data. It does not come with its own data but can import data from APF, Percon, ScanWare, and UFDBF database files.

Pro Data costs $60. For more information, write to prodata1@gte.net, or visit http://home1.gte.net/prodata1/index.htm.

RADIOMAP SERVICE

Developed by long-time Usenet contributor Bob Parnass, this service provides a custom report of frequencies, callsigns, and licensee names for a specified area in any of the 50 states. Coverage areas of 4 to 256 square miles will be chosen by Bob depending on transmitter site density. Standard and deluxe reports are available. Both reports include a color plot with transmitter sites marked. The deluxe report adds a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area.

To create the report, Bob requires the latitude and longitude (or nearest street intersection) of the center location. Standard reports are $29.95, and deluxe reports are $34.95. Write to Bob Parnass at 2350 Douglas Rd, Oswego, IL, 60543; call him at 630-554-3839 between 6-10 PM central time; or visit http://www.megsinet.com/~parnass.

APPENDIX

Here is table of data fields in the FCC master. Fields provided by various products are indicated by "#" or the field length, if known.

You mean like Tandy? Tandy/Radio Shack is a member of CTIA. So is Uniden.
Obviously their scanner business is not as important to them as we would
like to believe.

> Oh, and, a final flame... if you are one of the scannists

So are people who USE cellular phones. CTIA member companies are getting
the money to pay off congresscritters from somewhere. That somewhere is
people who pay for cellphone service. Turn off your cellphone and quit
buying hardware and airtime.

Source record: 91081

Hi
Has anyone repaired the keypads on a pro43?
a few keys not working here... opened it up and all looks clean. It there some conductive
coating that can be applied to the keypad to fix it or do I just need to replace it if I can find
the parts. Seems like the pad is ok visually but not electrical... Any ideas or folks with experience on this?

Good luck, let me know what you find out. I have almost the same problem, except someone who previously owned this thing allowed a battery to leak. The acid from the batteries ate some of the circiuits of of the keypad. Keep in tocuh, if I find out anything on my situation , I will likewise let you know.

Who cares if it is a hobby or a service? I do not participate in any service aspect and have had my license revoked in 30 years. I guess the FCC must see it as a hobby. Besides other services have been eating away at Ham radio spectrum for years to provide their services for a fee to the public.

Let's face reality of the two basic truths about mankinds endevors:

1. MONEY TALK AND BS WALKS

2. "THE GOLDEN RULE" - He who has the gold makes the rules

So who cares about all the inane arguements any way as the FCC and people with bucks will do what they want without everyone elses consent!

The reprogramming involves zeroing out the phone number and system ID entries in the phone's NAM.

This is done to prevent the phone from locking out the original owner's account due to fraudlent phone software running on the Service Providers system.

From: Howard <hgm@nb.aibn.com>
Message-ID: <ainF4.7012$oQ4.193468@sodalite.nbnet.nb.ca>
Source record: 91088

Recently I posted the following message. I am brand new to news groups, and
am not sure of proper protocol. What is the best way to sell my scanner?
Unfortunately, I do not know what to ask for it. As you can see, it is not
"Blocked" as the term goes, because we do not have that restriction here in
Canada.
Thanks for any advice you may have for me.

Howard Macfadzen (New Brunswick, Canada)

==========

I have a handheld, 200 channel Radio Shack PRO-34 Scanner.
It covers the following frequencies:

30.0000 - 54.0000
108.0000 - 136.0000
136.0050 - 174.0000
380.0000 - 512.0000
806.0000 - 823.9375
851.1125 - 868.9375
896.1125 - 960.0000

It works well, with nothing wrong that I know of.
Please make an offer.

Regards,

Howard MacFadzen

True, but they can't go into a hearing with a select run of Deja-News
and wave printouts of people writing about "Where's the mod" and "I
heard my neighbor set up a liason with his boss' wife, haw, haw" from
the people who buy phone service. Only from this group.

This law smells fishy. If an industry association supports this kind of bill,
then of course corporations may have bribed those two senators. This is also what
happened to the Digital Millennium Copyright Act, the Motion Picture Association
of America bribed Congress to pass this law. We are now just feeling the effects
of this law.

In both laws, there is the proposed "intention" of protecting themselves from the evil
"hackers". In reality, they just can't get enough money, and want to ensure that
everyone goes through them first for communications. They're probably already
making lots of money, but feel like they can't compete with a hobby!

We need to be more involved in government. Everyone should know what laws are
in Congress and have plain-English descriptions of them.

I suggest a group which mobilizes for a protest every time a certain law comes out.
Maybe about five to ten thousand people, protesting at several US government buildings
for as long as necessary until the general population gets what is going on and decides
to take action themselves.

-Mooneer (KG6AOV)

I see that http://www.jandr.com is selling a Sony scanner for under $100.00 it is model ICFSCIPC. Sounds like a good deal for that price, Does anyone have info on this scanner? Rich Wells also has a short review of this scanner and that site is http://www.strongsignals.net/htm/impsc1.htm I would appreciate any input that may help my decision to purchase this unit. Thanks

I think that the only way to solve this is to hammer the fact In to our congressmen's head that Dr. Armstrong doomed them to failure back in the 1930's when he came up with the superhet receiver.

Source record: 90896

Can anyone tell me if there is a scanner on the market for sale that can be modified to get cell phone freq's. I know they don't come that way anymore, but someone told me they heard that some can be modified.
Thanks

Peter Maus <PeterMaus@worldnet.att.net> wrote:

>
> Interesting editing, Eric. But you failed to address key points.

Two points...
1) thank you for fixing your headers so that alt.radio.scanner sees
these
and 2) please avoid ad-hominem attacks. They dodge the point.

> They neither have to be transmitted, nor to they have to be linked
> to the phones ID. They simply have to be known. What can be known
> can be stolen, or distributed.

But the radio is no longer the weak link. The goal is to keep radio
from being the weak link... the weak link becomes the physical
security of the cellular accounting database. Once the weak link is
no longer the radio link itself, the CTIA argument collapses and
we can stop going through this annual circus.

> My point is not that it has to be simple or publicly available,
> but that it exists. Never underestimate the power of determination.

But the weak link isn't that radio is used but that the key exists.

> Nice dodge...but this conversation isn't about Unix. It's about
> the ability of the determined to crack encryption. Different
> technology is irrelevant. Different results irrelevant. Different
> weaknesses, not relevant. There are weaknesses. They can be
> exploited.

But the daily successful hacks on Unix have nothing to do with
"cracking encryption" but with other problems. The encryption
is not the weak link.

Your whole argument seems to be that encrypion can be broken
therefore the radio signal is open to all, encryption or no.
I'm saying that it isn't so.

> And anything on it is accessible through it's wide distribution.
> Encryption
> is only a mask. The information needed to see through the mask
> exists. It is therefore retrievable. It doesnt' have to be
> convenient, it doesn't have to be easy, it just has to exist. Never
> underestimate the power of determination.

But it isn't retrievable by radio but by other methods. Therefore
radio is no longer the weak link. Therefore the yearly CTIA circus
dies a quiet death.

> > > And there are whole groups of people who
> > > do nothing but steal security algorithms.
> >
> > Irrelevent. Security by obscurity is a disaster waiting to happen.
> > Any "security expert" who thinks otherwise is full of shit. The
> > security should be just as good if all the details but the keys are
> > known.
>
> No it's NOT irrelevant...it's exactly what we're talking about.
> Security by encryption IS obscurity.

It most certainly, emphatically, absolutely is **NOT**!

Scrambling, voice inversion, SS all qualify as security by obscurity.
Once the method is known, the rest falls out easily. And usually the
method can be figured out. Jake Brodsky wrote an article on how to
use lab equipment to retrieve an arbitrary SS signal, for example.

Encryption is complex polynomial mathemeatics that given a key and
an input data stream, produce an output data stream. The relationship
cannot be derived from the data; nor can the clear text. This does
assume that the encryption algorithm is any good -- there are lots of
people who think they know how to write encryption algorithms and they
have glaring weaknesses, but I'm skipping those and talking about the
real thing -- good encryption.

> And the keys are aquirable.

But not by radio, which makes radio no longer the weak link, yadda
yadda yadda...

> Again, never underestimate the power of determination. What is known
> by one can be stolen by another. And with more agencies being
> brought into the loop, more people will have access to the keys. If
> the key remains in the user's phone, then it's stealable at any
> moment.

And if your phone is stolen and miraculously recovered? My
inclination is to reset it and clear the key and ask for it to
reprogrammed. Your carrier will already have the DSN on file
they'll know it's yours... a good implementation (yeah, yeah, I know)
of the setup system wouldn't give access to the display of the key;
rather it would generate a new key and give it to the salesweenie to
enter into the phone. Part of the user manual that comes with a phone
would have a "WHAT TO DO IF YOUR PHONE IS STOLEN" section, just like
phones used to say "YOU CAN BE OVERHEARD".

Sorry, I'm skipping the rest of your message because the point of
your argument seems to be just to argue, just as you accuse me of
doing.

My point, about 10 messages back in this thread, is:
1) CTIA is trying again to get at congress to screw up radio
2) They are doing it in "the name of the people"
3) An encryption system will do far more for protecting "the people" than their harebrained legislation
4) Encryption does and will work. Scrambling won't
5) CTIA's members have it in their power to really solve this issue, once and for all, but won't, so...
6) We have to again write letters to congress to educate them about who we are and what we do, AND propose an alternative to what the CTIA wants,
7) and we should put our best foot forward in this newsgroup to keep what we say from getting used against us by some congress-critter with a fat war chest courtesty of CTIA.

If we don't,
1) Scannists can kiss scanners goodbye,
2) SKYWARN volunteers will find themselves seriously impaired
3) ditto for ARES/RACES
4) the "alignment" will become a thing of the past because
5) rigs above 30 MHz will become black resin boxes
6) HAMS can kiss all their packet, digital and data modes above 1200bps goodbye.

Now, you can fight with me, or write a courteous letter to your Senators, since this time they're trying the Senate first. Your choice.

Eric

P. S. I'd be interested in hearing from someone with knowledge of key escrow systems and how they could be made secure... I think Peter's point of the key database being stolen is valid, but not necessarily relevent to our argument. But how would you best protect a set of keys? A couple of message back in this thread I thought of a 2 pair public/private key system that would make it impossible to retrieve the whole conversation without stealing the phone (thanks, grendal!) but I'm not a crypto expert. e)

With the edacs system you have to enter the freqs in the correct order. I have a uniden 245 and sometimes the reception is not the best. That usually is from the car, not the base station. Take a look at my web site, I have the freqs and talk groups in excel format.

Glad to see uniden is releasing a new box that hooks up to your tv.

Called the scanner box, puts it all on your tv set, using your existing tv antenna.

Glenn

Even a monkey would!!

Copy of an open letter to Senators Wyden and Burns, just now emailed:

I read with interest this nonsense you have introduced to protect wireless users from the evil scanner listeners in this country, and I'm shocked at your ignorance. You have said, "The millions of Americans who use wireless communications deserve to have their privacy protected. They should be able to enjoy the same privacy protection as landline phone users. The Wireless Eavesdropping Protection Act will help provide those protections."

Really???? How is that? Why on earth should someone who is using MY (the public's) airwaves have even the slightest expectation/right to privacy in that area? Landline users getting phones TAPPED is one thing, and this should obviously be illegal. But me sitting in my home listening on a radio to whatever happens through my house? GET GOVERNMENT OUT OF MY HOUSE!! Let these cellular users complain to their cell companies, and let those cell companies bear the cost of encrypting or otherwise satisfying their users. Why try to legislate it? It makes no sense, is offensive to me and free people throughout the country, and takes on something that rightfully should burden the commercial companies.

As I've heard it said, "as long as radiation is flying through the air and through my body, I have a right to know what it is and listen to it if it suits my fancy."

Most of the NYPD internet radio traffic that I heard are scanning many of the zone and SOD frqs. NYPD has 35 zone dispatch frqs. Operational wise it seem "easier" to do it this way until someone decides to change things around. I perfer SOD hecause I heard the major jobs. I switch to the zone when I hear an interesting job.

You know, I have a feeling this (eBay & the Sony Scanner) will come up on
r.r.s as a rather nasty topic for a while to come
... (considering the reports that J&R had hundreds of them to sell) at least
when someone starts posting a FS or FA for the scanner here!
Admittedly I was tempted to pick up more than a couple from J&R when I
put in my order for one (1) ;-)

I went to your site and has some wrong information. The freq's that you
have there in the 490 range are actually image freq's from 468.
Usually if you have a old type scanner, the IF in these was 10.7 Mhz
and you double that and make 21.4, this is what you are actually
listening to 21.4 Mhz above the correct freq. Also the A cars are
usually only saying that they are one out.

I recently bought a a Realistic Pro-39 scanner. Subsequent web searches indicate certain mods may be applied provided it is date stamped before a certain date.

I cannot find anythng on the radio that resembles a date stamp, and the only other alternate way of datig I can find is via serial #, but even that makes no sense.

The only thing I can find even close to a date stamp format is on the manual cover back page "7A2"

This is a Radioshack Realistic PRO-39 model# 20-303, serial# 048985, FCC ID# AA020-303.

All I need is the date of manufacture. Please assist if you can.

Sincerely,
grif@gci.net

> > >anything. [...]

I remember getting into a discussion with someone at work who had just
gotten into CB and was raving on and on about how convenient it was, and how much fun, so on and so forth. This was back just seconds before "Convoy" was released and triggered the huge boom in idiot CB activity. CB was also only 23 channels at that time, which was the crux of our discussion.
Anyway, she said that she and her husband had opened up their radios, and clipped a wire on the bandswitch and had found a new channel that NOBODY was on. (These were Radio Shack products, and you'll remember the blank spot on the dial that produced no channel activity...until this mod, of course.)And she was bragging about how she and her husband were able to talk in absolute privacy, without interference. At the time, and even today, it was illegal for an owner to open, and modify or repair a CB radio without a First Class Phone FCC licence. I mentioned this. We got into a staggering argument, over it, she insisting that once she had purchased the radio, she could do anything she wanted with it. And that the channel was already there, they had simply 'released' it. This is a pretty common belief, even today. Not only among CB operators, but among scannists and other radio operators as well.

Let's not even get into the freebanders.

The truth is that it has always been illegal for some radios to be opened or serviced without the proper FCC license. What seems to be happening in recent years in the Congress, however, and specifically with respect to CTIA, is that non radio savvy Congressmen are being lobbied in areas where they have no expertise, and have no working knowledge of the hobby, radio services in general, and ham radio in specific, and they pass these sweeping laws in the name of cell phone customers that run roughshod over most every radio service. Ham radio operators have been using radio

patches into the telephone system since there has been radio. Some automatic systems allow direct dial in from the ham radio transmitter. This is no different than a cellphone in theory and varies from cellphone practice only in the type of technology used. These are radio transmitters. No matter what encryption system is used, no matter which mode, they are not going to be secure. And like the spate of recent gun legislation, no one outside of the law, if they are truly motivated, will be stopped from intercepting these transmissions, and using what information may be found there. Perhaps licensing is the answer. But to enact blanket provisions that ban the repair and service of radios to prevent unauthorized mods, strikes two places at stripping away the very essence of hobby radio: 1) the do it yourselfer's who have, historically speaking, been on the cutting edge of radio development as well, and 2) the technically challenged, who would then be at the absolute mercy of equipment purveyors and service technicians who have neither the motivation to provide top drawer service performance, or the ability to be challenged by the customer about the quality of their service performance.
Literally, we would all be at the mercy of people like those currently found at Radio Shack, who would be deciding what is and is not proper operation of a radio, or what we should and should not tolerate as customers.

That's Bullshit. No Congressperson would tolerate being pushed into that corner. No Congressperson should be allowed to tell us that we have no recourse but to take it.
And, no surprise, but Tandy is a member of the very Associations driving
This legislation. They benefit both ways.

> Make no mistake: I don't, won't, nor will endorse monitoring of
> cell calls. I think they should be made private. Through encryption.
> Anyone who tells you that the phones don't have the horsepower
> to do it or that the individual AMPS/TDMA/CDMA boards at the cell
> site don't have the horsepower to do this is full of shit. CTIA
> is just finding it easier to buy congress than to put an additional

> reduced to "voodo black boxes" by law. You know and I know that
> anyone with a little time can get at cell calls today by using
> cell phone diagnostic modes, images from receivers, UHF tuners
> and so on. Cordless phones are even easier.

And this is the other issue. Only the law abiding will be harmed by any

of these laws. The truth is, that today, we have hobbyists writing
their
firmware and distributing chips for some very sophisticated
radios.
Perfectly legal modifications. One which I have seen recently
extended
the shortwave coverage to my Becker 2340 car radio, and changed
the
to accomodate the extended AM band. Perfectly legal and very
sophisticated worl You think for a minute, that a talented
individual with criminal intent and this kind of skill couldn't
rewrite the firmware for a 'potted' scanner? Or build one from
scratch that would not
only receive the forbidden frequencies, and decrypt the incoming
data
stream?
Making it illegal is no deterrent to the determined. Murder
has been
illegal since the dawn of civilization. Anyone read the headlines
lately?
Bank robbery has been illegal since the beginning of the banking
industry.
Read your contract and be surprised.
Banning cell capable receivers is not going to do the job.
Hell,
banning all radios isn't going to do the job. Those determined to
listen
will not be deterred by laws, sanctions, punishments, or
restrictions.

>
> I want my phone calls to be private. So, let's encrypt and fix
> the problem!

No, if you want your phone calls to be private, then pick up a
land line. (For the time being we'll not address what's currently
being done to them that renders this whole discussion moot.)
Encryption is only "the Club" on the steering wheel of your Ferrari.
But it only takes 30 seconds to cut the
wheel, and remove that security device. Just as it only takes a few
seconds to decrypt the most secure cell call once you've got the
key. DSS, is no better once you've got the PN codes from the same
series device.
Get this and get it good: NOTHING IS SECURE. That's a reality.
And
Washington not withstanding, nothing will change that reality.

If you don't want your calls monitored, don't distribute them
by radio.

>
> > That's my opinion; doubtless there are others.

And it's a good one..It just doesn't go far enough.

Will be traveling cross country on Amtrak soon....any good freqs,
particularly on board communications?

thanks

That was the nature of the xtal "syntesized" CBs -- they used a 6x4
matrix of xtals to come up with the 23 channels, plus 1 extra freq
that didn't correspond to one. But I digress..

> No matter what encryption system is
> used, no matter which mode, they are not going to be secure.

That's not true -- you are confusing encryption with scrambling.
A good encryption algorithm -- like the original DES in its day --
cannot be broken, even when all the internals of the mathematics
are known. The key, or brute force, is the only way to do it, and
usually brute force attacks require more time than the Universe
was around... Of course, DES was weakened and computers caught up
to it, but a DES encrypted call made 15 years ago was secure for
15 years -- that's good enough for me. See "Applied Cryptography"
for more info into this subject. But it isn't scrambling, which
takes no effort at all to break.

True, but I would also argue that one must be responsible when using their communications tools as well.

As it happens, we need no more laws regarding what we can and cannot listen to. We have enough. If they aren't working it is because people don't WANT them to work; folks are not (yet) motivated enough to have scanner police going around looking for folks with modified -- or even legal -- scanners, listening to cell phone calls.

Not that they NEED to; we seem to have a reserve of idiots who insist on publicizing their lack of manners.

This particular travesty is much more threatening than telling a bunch of scanner listeners to quit snooping on neighbors; it sets up for the first time in this country a system whereby people will require prior authorization to receive signals. And it does not specify what types of signal are authorized. Previous laws have only sought to rule some signals - -ones where the expectation of privacy could at least be hoped for -- off limits. This one requires that in order to listen to ANY RF communications, one must have permission. Might listening to China be forbidden? Radio Free Washington? CBS?

And it's European, not American. It's NOT the way we do things here. In this country, freedom means that everything not forbidden, is permitted. There, everyone has a master, and every action requires authorization. THeres, freedom is the property of intellectuals, philosophers and rulers, doled out to ordinary folks. Everything that's not authorized, is forbidden.

I don't like their approach. They ARE more peaceful, more secure. THey are NOT more productive, more inventive and more receptive to progress. This Bill is a fine example of security paid for with liberty. Let's see it defeated.

So much for our freedoms. They tried to get a Flag Amendment passed and it failed, now they are trying this. It will also fail.

People need to wake up in this country. Almost everyday we hear about some other law that will infringe upon our Constitutional Rights. As each Amendment gets passed, another right goes down the drain, and then another proposed Amendment comes up.

If the Constitution isn't broken, don't fix it.

As for listening to scanners, where is the damn proof that it is harmful to law enforcement or anything else? It's like guns. If they outlaw guns, only outlaws will have guns. Scanners are the same way. As long as the parts are available in electronic stores, people will build their own. I know I would.

I like to know what is going on around my area. I also like to know why I am sitting in traffic and the AM/FM radio isn't announcing the problem. I also like to know the character of the people that I pay to protect me and my property. You hear a lot of garbage on the air.

Back in the "old" days, you could pick up police calls on a regular AM table radio.

And, as someone else said, as long as radiation is flying through the air and through my body, I have a right to know what it is and listen to it if it suits my fancy. EVERYTHING that has been so called coded for transmission has been cracked by someone. Mobile Data Terminals, Satellite TV, Morse Code, etc.

No, I'm speaking of encryption.

> cannot be broken, even when all the internals of the mathematics
> are known. The key, or brute force, is the only way to do it, and
> usually brute force attacks require more time than the Universe
> was around... Of course, DES was weakened and computers caught up
> to it, but a DES encrypted call made 15 years ago was secure for
> 15 years -- that's good enough for me.

Thank you for making my point for me. Any encryption system
requires a key. Those keys are known. And the truly determined will
not be stopped by
mere laws. DES was caught up to with contemporary computer
technology. The truly determined won't wait. And the more people
that know the key, the greater danger that it will find its way into
the hands of those that these blanket laws seek to address.

Security is becoming an issue on a number of fronts. And hackers
have been demonstrating for months now, that supposedly secure
systems are anything but on the internet. Digital encryption of
communications are no different. And the very idea that a system may
be made private and secure is contrary to the evidence before our
eyes in the newpaper everyday.

Further, there are new laws requiring the 'authorities' whomever
they may be,to be allowed access to all such encrypted
communications technologies as a condition of license. CALEA is an
example of such. Now you have the government and its agents all
involved in the inteception of communications, supposedly by court
order, but that's a irrelvant matter. The fact that so many
individuals have access to the technology to decrypt, is in and of
itself a security risk. Get one determined individual to lay hands
on such technology, and it's all over the Internet before you know
it's been cracked.
You dont' have a 15 year window anymore. Once the algorithms are
in use, they are stealable. And there are whole groups of people who
do nothing but steal security algorithms.

Here in Chicago, there was a major controversy over something as simple as a person's name encrypted onto their ATM card so the terminal could address them in a more personal fashion. A firestorm of protests followed, and was punctuated by the lone voice of a computer hacker interviewed on the news. He said simply, "for every piece of data out there, there is at least one person who will use it against you."
He went on to say that the whole digital age has made things so much easier for the hacker because all you have to do is steal a key and you can get into anything. He was very emphatic on that point. Computing power is today where only science fiction imagined it 5 years ago. And hacking is becoming a major industry, with new and more poweful tools, and staggeringly creative minds at work. The circles of hackers are not only wide and deep, but they're above ground. They hold conventions for crying out loud. If you honestly believe that there is a system out there that is so secure that it cannot be cracked, they you underestimate both power of determination, and the disregard for the law that's out there in the population.

> See "Applied Cryptography"
> for more info into this subject. But it isn't scrambling, which
> takes no effort at all to break.

I understand this point. One of the reasons that encryption systems are so attractive is that they require skill and effort. It's like the quest for the holy grail.
And systems are broken every day. Newer ones. With far less of a security window than 15 years.

The more people that get into the loop, the greater the risk of security breach, and these new laws are almost self defeating. One cracks down on the legal hobbyist, while another mandates access by thousands of individuals to the very technology created to ensure security.

Again, the point is relevant: if you want to make your communications secure, then don't distribute them by radio.

Glad to see uniden is releasing a new box that hooks up to your tv.

Called the scanner box, puts it all on your tv set, using your existing tv antenna.

I recently purchased an Optocom Communications Reciever and Scan Star Deluxe
with the intentions of trunktracking an Ericsson EDACS system.
To date I have been unsuccessful in doing so and perhaps someone using this
same setup would give instructions on how to do so.
I requested technical assistance from help@scanstar.com on March 15, 2000 and
have not recieved any response and don't believe that I ever will.
Any assistance or advice someone might offer would be much appreciated.

Gentlemen,

Such confusion. Good encryption is within reach of all. It is hard to use. It is tedious to manage. But it is available. PLEASE don't mistake the algorithm for the system - they are entirely different. Algorithms are best when publically tested - please visit the Right Honorable Bruce Schneier's web site at www.counterpane.com.
Private Keys are NOT known, fair sirs. Only PUBLIC ones....
Oh, please do educate yourselves before you fall, writhing in confusion, into that black mass of public ignorance from which we all have crawled.....

sorry for being repititious, but this may be of aid....

Mr. Bowers,

If you shout your message out your window to another person and I hear it, does that make me a
criminal? If you write a letter and toss it on the street without an addressed envelope and I read it, am I a
criminal? If you use FRS and I hear your conversation am I a criminal? How about CB? By your
'standards', of course I am. Nowhere in the constitution are you or anyone else guaranteed the right to
PRIVATE communication using PUBLIC media. Well, guess what, Mr. Bowers, radio is a PUBLIC
MEDIUM. Your transmissions enter my PERSONAL airspace. They impinge upon me and my radios
without my invitation or permission. YOU, Mr. Bowers, are the trespasser, not I.

Privacy when using a public medium is the RESPONSIBILITY OF THE USER. If you choose a service
provider that can guarantee your cellular privacy, fine. If you can find a cordless telephone system that
ensures your privacy, fine. Wireline telephony is NOT a public channel, sir. If you choose to intoduce a
public medium at your end, YOU take the risk. Get it yet? Encrypt your email messages, Bowers, because
I GUARANTEE that if I find them, I'll read them. The same, sir, goes for your conversations that traverse
the public wireless media.

Don't worry, though. If your mind has been so warped by your Nazi legislators and their industry
backers, it's not your fault. We can blame (your) ignorance and the media. The Media will continue to
tell you what to think. You'll continue to vote more of them into office, expecting them to protect you
from the burden of personal responsibility. And one day, Mr. Bowers, you - or your children, or your
grandchildren - will be arrested for not being able to produce proper credentials while walking down the
street. Or for watching an UNAPPROVED television channel. Our freedom is what makes our country
beautiful. Nothing else. Not all the monuments or grass or dying trees,

SUV's or superhighways, cult
temples in the wilderness or cultural disease. FREEDOM, Bowers. If you can
yank your head out of
your ass for just 10 seconds, you might realize what you've said here. If
not, sir, may the Soul of Freedom
damn you and all your kind.

Finally - before you spew some inane excement about my mask - my identity is
MINE and I choose NOT
to allow you to reply directly. The public forums are the battlefield, not
my mailbox. I encourage you to
continue your mindless postings here. We will all be better for it. We will
understand and clarify our
argument and - in the end - know what we've lost or gained. Freedom is not a
single fight - its price is
vigilance and action. Look back at the Jews in Europe and find, in your
hearts, a way to excuse this trivial
erosion of our freedom's shore. Quite frankly, I would find it hard to reason
why ANY - yes, Senators,
policemen, FBI agents, and ALL the SS - should not be REQUIRED to communicate
in the clear unless
allowed to privatize their conversations under a court's supervision. How's
that, Mr. Bowers? Does it
make you and your elected uneasy? It should.

John Bowers wrote:

On Sat, 01 Apr 2000 01:55:46 -0500, money@corrupts.laws wrote:

: Here we go again! The Cellular Telecommunications Industry Association
: (CTIA) strongly supports the Wireless Eavesdropping Protection Act of
: 2000, introduced March 29, 2000 by U.S. Senators Ron Wyden (Oregon) and
: Conrad Burns (Montana)of the 106th Congress. It bans scanners regardless
: of what type of technology is used.

It's becoming increasingly clear that the old days of unrestricted radio
reception are over. Scanning cell phone frequencies is illegal, as it
should be, and it is way past time to clamp down on the snoopers who
enjoy eavesdropping on conversations which should remain private.

For example, using a scanner to listen to cordless telephone
conversations is not only a bit sick, it is also the ethical equivalent
of tapping the victim's telephone directly for no other reason than that
you are curious. Cordless phone scanning should be banned.

Scanning police frequencies not only allows the listener to pick up
potentially damaging information about other citizens, but it also can
be the means by which law enforcement's job may become more difficult
and even more dangerous. Encryption is so far an unsatisfactory option,
because encrypted communications are usually less intelligible (that's
why most police officers prefer not to use encryption), and because
encryption won't work reliably, if at all, between different police

jurisdictions. The scanning of police and emergency frequencies should be banned too.

And secured. And never, ever transmitted over the air. The
association between a key and the phone's ID should not be able
to be derived without access to the account info, in which case
you screwed no matter what.

> And the truly determined will
> not be stopped by

That's true, but it has to be an inside job, as opposed to the
equivalent of running naked through the streets.

> Security is becoming an issue on a number of fronts. And hackers
> have been demonstrating for months now, that supposedly secure
> systems are anything but on the internet.

Different issue. Unix was never designed to be secure; sendmail has
always been a disaster waiting to happen. While they both do their
job adaquately, a poorly config'd sendmail script, a bad .forward
file, or a program installed with SETUID or SETGID set that shouldn't
have it set, or read access to /dev/kmem, and it's all over... The
current password algorithms, on the other hand, are very good. But

the trapdoor algorithm doesn't help here. (As an aside, I've always found it interesting the the pre-eminint expert on Unix security is also the editor of The Unix Hater's Handbook... :-))

> Digital encryption of
> communications are no different.

Yes they are. Different hardware, different results, different weaknesses. Unix's weakness is its original security model, which was designed for openness, not restrictiveness. Cellular radio's weakness is the radio link itself.

> Further, there are new laws requiring the 'authorities' whomever
> they may be,to be allowed access to all such encrypted
> communications technologies as a condition of license. CALEA is an
> example of such.

CALEA is unconstitutional. However, we need someone to challenge it, and that won't happen until a Bill Gates or other tycoon finds hauled into court with warrantless "evidence."

If the gov't wants to listen, they could always tap at the central office. The fact that the last link is by radio changes none of that.

> The fact that so many
> individuals have access to the technology to decrypt, is in and of
> itself a security risk. Get one determined individual to lay hands
> on such technology, and it's all over the Internet before you know
> it's been cracked.

But it's all brute force and you don't have the time.

> You dont' have a 15 year window anymore. Once the algorithms are
> in use, they are stealable.

So what? A good encrytion algorithm, almost by definition, has its entire structure and method known. If it has a weakness, it'll be broken, but that's not a good algorithm. There are good algorithms under attack in massively parallel systems now that aren't yeilding. THOSE are the ones you want. The key stays in the phone and in the accounts database, and anyone who can get to the accounts database can get to your conversation easily enough using other methods. You trust -- to a limited extent -- the twisted pair outside your house to carry your calls with relative security, right? All that encrypting the call would do is move the weakest link in the chain from the radio link to the wire/fiber network. I can live with that...

> And there are whole groups of people who
> do nothing but steal security algorithms.

Irrelevent. Security by obscurity is a disaster waiting to happen. Any "security expert" who thinks otherwise is full of shit. The security should be just as good if all the details but the keys are

known.

> Here in Chicago, there was a major controversy over something as
> simple as a person's name encrypted onto their ATM card so the
> terminal could address them in a more personal fashion.

"encrypted" using what as a key? Sounds like scrambling or just
plain recording it to me. Your PIN is on your card in purely
readable form.

> He went on to say that the whole digital age has made things so
> much easier for the hacker because all you have to do is steal a key

Yes, so you protect the key.

> and you can get into anything. He was very emphatic on that point.
> Computing power is today where only science fiction imagined it 5
> years ago.

That's not true -- Moore's law has been accurately predicting computer
growth since the 60's. No one wanted to believe it would continue
unabated, though....

> > See "Applied Cryptography"

I can keep the difference between an encryption algorithm and a key
straight. :-)

I don't know if you were suggesting the use of public/private key
systems, a'la RSA for cell phones, but I think that's a good use for
them... although, some interesting ideas are coming to mind.... but
I was thinking of a symmetrical, single key system.

Thanks for your contribution to the mudfest! :-)

They neither have to be transmitted, nor to they have to be linked
to the phones ID. They simply have to be known. What can be known
can be stolen, or distributed.

My point is not that it has to be simple or publicly available,
but that it exists. Never underestimate the power of determination.
>

Nice dodge...but this conversation isn't about Unix. It's about
the ability of the determined to crack encryption. Different
technology is irrelevant. Different results irrelevant. Different
weaknesses, not relevant. There are weaknesses. They can be
exploited.

> Unix's weakness is its original security model, which
> was designed for openness, not restrictiveness. Cellular radio's
> weakness is the radio link itself.

And anything on it is accessible through it's wide distribution.
Encryption
is only a mask. The information needed to see through the mask
exists. It is therefore retrievable. It doesnt' have to be
convenient, it doesn't have to be easy, it just has to exist. Never
underestimate the power of determination.

The constitutionality of CALEA is irrelevant. It exists, it will
be used.
>
> If the gov't wants to listen, they could always tap at the central
> office. The fact that the last link is by radio changes none of that.

Which was the contention of CALEA opponents. However there are
cellular and PCS devices that now speak to each other without going
through the land based network. These would be more specifically
addressed by CALEA.

Don't be so sure. Saying that no one has the time to accomplish
something verily insures that someone will find a more efficient
way.

> security should be just as good if all the details but the keys are
> known.

No it's NOT irrelevant...it's exactly what we're talking about.
Security by encryption IS obscurity. And the keys are aquirable.
Again, never underestimate the power of determination. What is known
by one can be stolen by another. And with more agencies being
brought into the loop, more people will have access to the keys. If
the key remains in the user's phone, then it's stealable at any
moment.
>
> > Here in Chicago, there was a major controversy over something as

> plain recording it to me. Your PIN is on your card in purely
> readable form.
>
Nice try..but you conveniently neglected to include the point. I
wasn't talking about the technology, or the PIN number. A
diversionary tactic that indicates you really don't want to hear
what's being said. Only what's convenient for you to address.

The point was not that you name would appear on the screen, or
that it was on the card, or that the PIN number was also on the
card. Nor was it about how the data was contained on the card. It
was about how information that is known can be stolen.

> > He went on to say that the whole digital age has made things so
> > much easier for the hacker because all you have to do is steal a key
>
> Yes, so you protect the key.

Which is again the very point. No protection schemes are fool
proof. What exists can be stolen. Make no mistake. That which exists
CAN be stolen. And it's a lot easier than you think. Because it
depends on people. No rules, no laws, no mechanisms, no technology
can prevent people from taking stupid actions, careless actions,
thoughtless actions or irresponsible actions. No law, no mechanism,
no technology, can prevent those that are determined from doing so,
from invading the 'security' within which a key may lie.
Never underestimate the power of determination. And never
overestimate the commitment of those keeping watch.
>

You get the point, then. Clearly you do not argue to purpose. You
simply argue.

> > > See "Applied Cryptography"

> stand by my earlier positions, AND re-recommend that book.

Not only the weak. There isn't a system been devised by man that
can't be compromised.

If you don't want your conversations to be intercepted, don't
distribute them by radio.

Winradio Cards, I want your thoughts and opinions.

I am looking into getting one for playing around and I was wondering if any owner/users out there have anything to tell me.
Also, If you are looking to sell your winradio card let me know.

Thanks in advance.

143. Scanner question

Newsgroup: rec.radio.scanner
Date: 2000-04-02 00:00:00 UTC
From: Steve Sliwka <ssliwka@msn.com>
Message-ID: <c4RF4.257$s06.270148@feed.centuryinter.net>
Source record: 90994

I'm new to scanners and I am purchasing my first one soon. I am technically orientated (I'm 16) so a technical model over a "beginner" scanner is preferred. I would like to spend no more than $350-400 USD. I plan to use it around my house and trips to Duluth-Superior in the 156.xxx Mhz range. I've been looking at the Trident TRX-100XLT and the Alinco DJ-X10. Cellular reception capability is a necessity...I could live without it but it is preferred!

What's your opinion on these two? Do any of you have any suggestions for a better/comparable model?

Thanks!

Steve

International Volunteer Ambulance organization in Canada with little funds needs to reprogram radios without the bother of finding dealers to do it. These radios were purchased and/or donated from various sources and need our frequencies.
We need your help with the software, if it is out there, and building of a programming cables from parts.
These radios can only be used for another year or two with our new regs on 12.5kHz bandwidth coming into force.
Help us out if you can.
Many thanks.
Paul

148. Fundyisles - Scanning Freq and Info needed?

Newsgroup: rec.radio.scanner
Date: 2000-04-03 00:00:00 UTC
From: Mark Fitzgerald <markf@campnet.nb.ca>
Message-ID: <I58G4.7484$oQ4.205470@sodalite.nbnet.nb.ca>
Source record: 90849

Hi,

Looking for other scanner listeners in or around the Fundyisles (aka)
Fundy Islands.
For those who don't know where the Islands are, they are in the Province of
New Brunswick,
County of Charlotte, Canada.

I am now in the process of putting together a web site which will have a
section on Scanning
in this area and others aswell. The Fundy Islands are .. Campobello Island,
Deer Island and Grand Maman Island. Campobello Island borders the State of
Maine (Town of Lubec,) via an International bridge.
Deer Island and Campobello are very near Eastport, Maine. Grand Manan Island
is about 8 miles off
the coast of Maine and about 8 miles from Campobello Island.

I have decided to try and compile scanner information for the list places
below and hope to hookup with someone else who has scanner frequencies /
info, for one or more of these areas. Any help would be much
appreciated!

Lubec, Washington County, Maine
Eastport, Washington County, Maine
.....
Campobello Is, Charlotte County, New Brunswick
Grand Manan Is, , Charlotte County, New Brunswick
Deer Is, , Charlotte County, New Brunswick
.....
St.Stephen, , Charlotte County, New Brunswick
St. Andrews, , Charlotte County, New Brunswick
Black's Harbour, , Charlotte County, New Brunswick
St. George and Bonny River, Charlotte County, New Brunswick
.....

Thanks for reading this!

Mark

I didn't matter to me, wasn't sure about what the scanner thought.
It gives me an error when I try to save the frequency, my guess
is now that that's not a valid frequency, and that the book I
bought is wrong or out of date.

This is an "older" radio - circa 1998 vintage. Must have been an overstock
situation and they bought all that Sony had left. I've seen posts that
the rig went for $300 new, which is why I decided to get one while I could!

Of course you can also pick up the PRO-2005 or PRO-2004 for even less.
Just about the same, features-wise. My PRO-2005 scans at 13/26 after a
clip here and a crystal there (simple, popular mod available anywhere).
The 2004 can probably do close to that. Out of the box the 2004 had only
300 channels, but one extra "clip" and you had 400! Another simple, widely
available mod.

> Hi Steve,

In my opinion only I would strongly recommend a Realistic Pro-2006 (they are cell capable). I have two of them running in the Scan*Star Slave/Master mode and they work great. One scanner goes out and looks for signals then puts the frequencies found into a waiting queue then the second receiver picks the next freshest freq in the stack to listen to. These receivers have excellent front end sensitivity. I bet you could pick up one on ebay for less than the amount stated. These scanners can also be fitted with the optoelectronics 456 board that will allow computer control and that is how I accomplish Slave/Master operation. With kind regards Mike Burch K8MB

Ok I'm seeing the crux of our conflict here. You're arguing
technology, and I'm not. My point is that the problem is with human
determination, not technology.

> My point, about 10 messages back in this thread, is:
> 1) CTIA is trying again to get at congress to screw up radio

Agreed.

> 2) They are doing it in "the name of the people"

With conditions, agreed.

> 3) An encryption system will do far more for protecting "the
> people" than their harebrained legislation

Agreed. However it will not solve the problem.

> 4) Encryption does and will work. Scrambling won't

Scrambling will not, agreed. Encryption can be defeated.

> 5) CTIA's members have it in their power to really solve this
> issue, once and for all, but won't,

Agreed, but by different methodology. My point is for CTIA to
simply admit that these are radio transmitters and that there
best
efforts may not be enough, so users should refrain from
discussing
sensitive material via this medium.

>so...
> 6) We have to again write letters to congress to educate them
> about who we are and what we do, AND propose an alternative
> to what the CTIA wants,

Agreed.

> 7) and we should put our best foot forward in this newsgroup to
> keep what we say from getting used against us by some congress-
> critter with a fat war chest courtesty of CTIA.

Should and will are two different things, as evidenced that
there
are those here who STILL express open intent to conduct
illegal activities re: cell mods and their like and their
kind.

Should; agreed. Will; won't happen. Never underestimate the
power of
deterimination.
>
> If we don't,
> 1) Scannists can kiss scanners goodbye,
> 2) SKYWARN volunteers will find themselves seriously impaired

> 5) rigs above 30 MHz will become black resin boxes
> 6) HAMS can kiss all their packet, digital and data modes above
> 1200bps goodbye.
>
All agreed.

> Now, you can fight with me, or write a courteous letter to your
> Senators, since this time they're trying the Senate first. Your
> choice.

My letters have already gone out. However, there is no one on the
Senate floor to take the place of Mr Goldwater, who had a deep
commitment to protect radio hobbiests interests.
Further...discussions tend, like this argument, to dwell on
technology and not on human activities.
And NO one not even the Republicans in teh Senate, for all their
blather about responsibility, will tell the CTIA to start telling
the truth to their customers.

Hope is thin, my friend.

Welcome to the Auxiliary Communications Service Newsletter, developed by the ACS Training Unit of the State of California Governor's Office of Emergency Services. Please visit our ACS Home Page at http://acs.oes.ca.gov

The purpose of this weekly newsletter is to bring those of us in emergency communications closer together by sharing common ideas, and by introducing new technology into the emergency services community. All individuals with an interest in emergency communications, disaster preparedness or helping the community at large are encouraged to participate here in an open forum.

You will find a virtual community here, with representatives from many different organizations with the same common goal: emergency response. We encourage everyone, from whatever organization you represent (or just yourself!) to bring us your ideas, suggestions, concerns, manuals, handbooks, or opinions so that we may share them with the group. To those of you who have just joined us, welcome aboard!
.....

This week's EMCOMM Bulletin:

EMC230 Amateur Radio Withdrawn!
To: Emergency Communications Units - Information Bulletin
To: Emergency Management Agencies via Internet and Radio
By: Auxiliary Communications Service (ACS) of the
California Governor's Office of Emergency Services

EMC230 Amateur Radio Withdrawn! For release 3/27/2000

FCC Order No. 87

"At a session of the Federal Communications Commission held at its offices in Washington, D.C. on the 8th day of December, l941:
Whereas a state of war exists between the United States and the Imperial Japanese Government, and the withdrawal from private use of all amateur frequencies is required for the purpose of the National Defense;
IT IS ORDERED, that except as may hereafter be specifically authorized by the Commission, no person shall engage in any amateur radio operation in the continental United States, its territories and possessions, and that all frequencies heretofore allocated to amateur radio stations under Part 12 of

the Rules and Regulations BE, AND THEY ARE HEREBY, WITHDRAWN from use by any person except as may hereafter be authorized by the Commission. By order of the Commission:
- T.J. Slowie, Secretary."

A few hours after the first bomb fell on Pearl Harbor, Amateur Radio in normal peacetime ceased to exist. The frequencies we used were deathly silent - an ominous nothingness, not a chirp, nothing.

Transmitters were packed away, receivers turned to some other use. Soon the U.S. Government wanted to buy "commercially made" transmitters and receivers. My Hallicrafters Skybuddy receiver and a Stancor 200 watt AM transmitter went to the war effort.

Today thousands of Amateurs have no knowledge of those events, so this bulletin is a reminder of Amateur Radio privileges.

Prior to WW2 I participated in a forerunner to the ARRL ARES (Amateur Radio Emergency Service.) There was no RACES or other emergency communications (EMCOMM) unit in use by government.

After WW2 ended the right to operate on Amateur frequencies was restored. I was in the U.S.Navy and my parents mailed my CW transmitter (an 807 and a rectifier tube and few other parts.) What a thrill to be on-the-air again. CQ....CQ....CQ de .....! WOW! It was great! Even if it was from outside a navy base, since operation from the base was not permitted.

So, why write about this in the year 2000? As a reminder that the use of FCC assigned Amateur frequencies is a privilege, not a right.

The FCC regulations say that the paramount purpose of the Amateur Service is PUBLIC SERVICE. I understand that to mean to help our communities in time of need with our skills and abilities in communications. In the year 2000 there are many ways to do that. Numerous organizations, methods and means exist so you can help those in your area.

Please find a way to make that part of your future. The rewards that come to you will be those you don't expect, but will find interesting! If my experience is indicative at all, you will find ways to be of help you cannot anticipate. 73's de W6WWW

To subscribe to bulletins, use the Subscription Services web page at <http://acs.oes.ca.gov/subscribe.html>. If you don't have web access, just send an e-mail message to <mailto:emcomm-bulletin-sub@harthaven.com>.

- Ideas, suggestions and submissions for these bulletins are actively solicited and welcomed. Please contact

cary.mangum@macnexus.org or cary_mangum@oes.ca.gov

Bulletins are on the ACS Web page: http://acs.oes.ca.gov -and a
Landline BBS: 916-262-0856 (graphical & standard interface); and

It's actually about the powerful wanting to use the cheap toys w/o having to worry about any of their odd conversations coming back to haunt them.

such things as the use of intercepted communications in political campaigns will do nothing for the monitoring community.

the rule makers are probably in that job because they don't wish to know the laws of physics and don't like their snouts rubbed in them either.

If you are hearing what you want to hear without a trunking scanner, I'd
say save your money. Pick up a scanner freq. guide and see if anyone
you are interested in listening to is running on a trunked system, then
decide from there.
There are others out there who can describe "trunking" much better than
I can. A good info site is the Strong Signals Page:

www.strongsignals.net

Works great on EDACS for me. I have 2 OptoCom's and both work just fine.
You may want to try again with Opto, they have always responded quickly
to my requests, as has ScanStar.

A couple things to check:

1) Is it really an EDACS System?
(Are the beeps present after transmissions etc?)

2) Do you have it programmed correctly?
(Selected EDACS as the type for each freq AND within the System
selection, and the chanels are in the correct order, and all are
present)

3) Does your OptoCom have a BitBanger?
(Check the system revision with Optcom24.exe, available from Opto's
web page)

4) What version OptoCom do you have?
(1.4 or 1.5 is required for EDACS)

5) What version of ScanStar Deluxe have you got?
(Again, later versions are required, check the version history from
ScanStar's web page for the one you have. If needed you can
download the latest update there.)

John
I have the same problem. First the scan button stop working and now
two other buttons have stop working. Would you please let me know
any information you receive from your post. I would like to get radio
fixed. I was thinking of taking a look myself. If you come with a service
manual for this radio I would interested in getting a copy. If I get any
information I will pass it along to you.

Ghosting is when you are receiving a TV channel and the reflections
from objects of that signal arrive at your tv displaces by a small
amount of time causing ghosting of the picture.

Gentlemen:

I have been in Thomas.Loc.gov and looked up the changes to the law. The Changes are S 2326. Senator Burns and Senator Wyden are very gullible. These guys aren't thinking correctly. They have modified with the word "intentional" a few of the passages to read "intentional interception" and not bothered to really read it for fallout.

Ladies and Gentlemen, I submit that we "intentionally intercept" when we build or modify a box to do just that. When we are tuning around the freqs we are trying to intentionally intercept those communications. Usually, any time we do this it is for entertainment purposes. It doesn't step on anyone's toes UNLESS SOMEONE TALKS about it. We do this on a casual basis, I.E. not everyday, or for harm or money. But we can not let the law be changed to be more specific in that it will cut off all those fun things and it will not define those fun things again.

The changes reflect no such "casual use" and therefore in my mind, if you have to have one type of intention, you have to define the other more casual one. This reminds me of HR514 that Rep Tauzin of Louisiana tried to pass, but from the Senate side. It still comes out to be the same old. The changes do rely on Chapter 118/119 of the Communications Act of 1934 for definitions of purpose. The text specifically outlining casual use such as Ham Radio, Ship to Shore and such will be stricken from the 47 CFR 18 USC Sec 605 with the proposed changes.

Senate Bill 2326 has not made it into the database. S 2326 is the changes to the 47 CFR 605 Section 750. The text is available though. See if this URL works for you:
http://thomas.loc.gov/cgi-bin/query/D?r106:1:./temp/~r106Mczgc7:e253211:

Write your Represenatives and Senators ladies and gentlemen, as the legacy of Newt Gingrich tries to rear it's head once more.

Hi, I bought a Radio shack Pro-94 this weekend and have a couple of questions about entering frequencies. I bought a book there that lists all of the Police, Fire, etc. frequencies for my state which is Texas. I entered the number for Leander Police, 154.1000 as stated in the book. The scanner won't accept the last 0 it seems to round it off to 154.100. Is this what should be happening? I also noticed that all frequencies either end in 0 or 5. Is that correct? One more thing, I didn't get any reception on this frequency. Is it common to not have any traffic on a specific frequency.

Tom

It's just dropping the last zero which still makes it a zero.

>I also noticed that all frequencies either end in 0 or 5. Is
>that correct?

If you're referring to the 4th decimal place, yes. Otherwise no.

> One more thing, I didn't get any reception on this
>frequency. Is it common to not have any traffic on a specific
>frequency.

That's a little difficult to answer. If you've got the right
frequency, I'd think it a little odd not to hear any voice traffic. I
would double check the frequency. Maybe the guy at RS who sold you
the scanner has a list of local frequencies. The easiest way to find
freq's on the net (IMHO) is to do a search on the word "frequencies"
AND the name of the place you're looking for. Oh and one other thing,
those books at Radio Shack are notoriously inaccurate and out of date.

Good luck!!

As I understand it from posts to other groups, you have to replace the
rubber keypad when this happens. Replacement keypads are available from RS,
go to radioshack.com and click on product support, its pretty self
explanatory from there. Once you get the part nbr you can order online,
call the 800 number, or have your local store order it for you.

I'm looking for any FBI frequencies that can be heard (i.e., unscrambled) in the Philadelphia, PA area.

Any links or info would be greatly appreciated.

Thanks in advance

211. Using/Importing a BC245XLT in/to the Netherlands

Newsgroup: rec.radio.scanner

Hi,

I live in The Hague, The Netherlands. The local police is using a EDACS system.

I want to buy a BC245XLT to listen to the local police, but onfortunatly the BC245XLT is not for sale in The Netherlands.

Is the BC245XLT a good scanner? Is it worth to buy one in the USA and to ship it to the Netherlands? What is the cheapest online store to buy a BC245XLT? Is there somebody in the Netherlands who is already using this scanner?

Bye,
Edwin

> and the pro 2006. Can the 2005 be upgraded to the 2006.

You can't "upgrade" as such, but there is really no need to. The 2005 and 2006 offered the same freq coverage and number of channels. AFAIK, the only REAL difference was scan speed. Out of the box the 2005 did 8/15 while the 2006 did 15/30, as I recall. (I'm sure someone here will correct me if I am wrong). However, clipping one diode on the 2005 offered a 10% increase in speed (or was that inserting another diode), and swapping the oscillator in the 2005 with a crystal around 10 MHz added more speed.

In theory, you should be able to increase the crystal value to around 11, 12, or more MHz for even more speed. Problem was if you went too far, the receive wouldn't lock onto signals. Another downside of speed mods was that the increase in scan speed reduced the built in DELAY feature in a linear fashion.

My 2005 has a 10MHz crystal with the "extra diode fix" and I have been scanning at 13/26 for many years now! I highly recommend Bill Cheek's Scanner Modification Handbook to anyone interested in toying with the 2004/5/6.

Hi Everyone :-)

I have a scanner Uniden Bearcat BC 350 A.
As You know it have few preprogrammed service bank (police,fire etc.)
and frequences in them are non erasable :-(This frequences are not useful
in Poland.
My qestion is : Is it possible to change this freqences from banks on the
others??
Or erase them and have more additional programmable chanels??
I wrote to UNIDEN e-mail but a have no responce :-(
If You can,pls,help me.
With compliments
Michal Czaja,Poland.

If you are looking for equipment, or have something you want to trade or sell, our new message board will email you when you have replies to your ad's. This will keep you informed so that you do not have to keep checking back to see if anyone has replied to your advertisement.

You can scan down and look at topics, create your own topic of discussion without have to read the entire message.

Like I said, if you have something to sell, something you are looking for, or just need help or information, place your add on our new message board, and when you have a reply, you will be emailed and told who replied to it.

Just go to the CB City Website at "cbcity.com" and click on "Msg Board" and it will take you to where you can post or read the Swap-Shop Advertisements.

We have had one of the most visited Swap Shop message boards on the internet, and have seen a lot of sales take place.

Come on by and check it out, you will be glad that you did.

Our URL is in the header of this message, some come on by.

Dean

Well, my old 40 ch Uniden gave up the ghost a few days back. Upon looking at all the new stuff, trunk tracking, etc I got a head ache.

1.) I'm looking to spend no more than $300-$350.
2.) Still not sold on a handheld or base. (are there any tradeoffs in performance in a handheld?)
3.) Just how important is trunk tracking? I get the impression that the larger metro areas have lots of trunked comm. Allentown PA??? Don't want to pay for something I'll get little use out of.

Anything anyone cares to share with me from specific model preferences, given my price range, to specific features, importance, etc. would be GREATLY appreciated.

Thanks

Doug Steckel

Source record: 90811

i got a few of those close out radio shack antennas when they sold for get this...98 cents!

i shoulda bought a $hitload of those dang things. i coulda made some doh!

all kidding aside i think its an excellent all around antenna, that greatly out performs the channelmaster which is intermod city. that thing really pulls it in. except for 880 mhz...and if i needed one id pay 15 bucks no prob.

at least hes not as bad as the sony scalpers anyway...Ha!

you are probably listening to the HF network operated by ARINC (Aeronautical Radio Incorporated) They operate a worldwide network of HF or shortwave frequencies used for LDOC (long distance operations and control) Air traffic and weather information is also transmitted on these frequencies.

224. Re: CHP Freqs for Wrightwood area

Newsgroup: rec.radio.scanner
Date: 2000-04-04 00:00:00 UTC
From: JA Moran <john@analon.com>
Message-ID: <38EADF37.C5A1472@analon.com>
Source record: 90814

GEnerally for the CHP, I set one of my scanners (I usually travel with two, an AOR-8000 and an AOR-7000) to search 39.00 to 43.00 This finds me CHP traffic on either 39 or 42mhz frequencies. I found that to monitor CHP traffic, it works best, if you feed the scanner with a CB antenna or something designed for lower frequencies. CB is 29mhz. A scanner antanna typically is designed for 150, 450, and possibly 860mhz frequencies

to determine wavelength in meters divide 300 by the frequency in MHZ by 300
example 300/150 =2 meters 300/900 = 0.33 meters

300 is a constant from Physics..... frequency must be in MHZ

do you just want LOs Angeles POlice, or the sheriff too.... by surrounding
cities
which cities.... LAPD is on 506-508mhz
LA Sheriff uses 470 and 483-486 mhz frequencies....
let me know what ya want.
JOHN

228. Cobb County Georgia Trunking System

Newsgroup: rec.radio.scanner
Date: 2000-04-04 00:00:00 UTC
From: Richard Lewis <lewisfam@mindspring.com>
Message-ID: <38EA9985.44CAAB32@mindspring.com>
Source record: 90818
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I would like to scan Cobb County, Georgia with a Pro 92. I have a list of frequencies from two sources. They are identical, except for the trunking type. One says Type 1, Map P12. The other lists a IIi, with fleet map E1 P12.

Does anyone know which is correct?

Thanks,
Dick

Hi All,

If you are interested in the work of some of the world's top aviation photographers, you will definately want to take a good look at

http://www.scramble.nl/photogallery.htm

Here you will find 103 super-shots of aircraft from around the world. For those of you that have visited this site before, please note that two more great photopages have just been added.

Also available are four pages with photos from the Scramble Aviation Photocontest. The nine winning shots of all four categories and the overall winner are available at

http://www.scramble.nl/photocontest.htm

A BIG Hi to All,

As far as I know there is still NO simple decoder which can decode the control channel of these systems and allow the frequency changes to be followed. Ideally this would run in DOS and use input from a soundcard or comparator, like other common decoding programs, to put control channel decodes on screen. I know there is an expensive professional standard hardware-based decoder available in Australia (A$400) but this is the ONLY decoder I know of short of BUYING an MPT 1327 radio!

These trunked systems are relatively common in the UK and worldwide and are used nationwide by Railtrack (around 205MHz), Electricity, Gas(140MHz), National Band 3 (180-206MHz) and Airports(455MHz). The system protocols are openly published and available on the 'net and the system uses 1200 baud FFSK for control channel signalling and for text messaging.

I've surprisingly found nothing like this on any of the sites I'd expected to find it on e.g. Eavesdroppers. Very disappointing.....

Can anybody help with this decoding/programming challenge? Has anybody tried to write one? Has anybody on here had any experience in writing other decoders for POCSAG, Mobitex, Motorola, ACARS, RTTY, FEC?

For a start, I need to get that 1200 baud datastream out of the soundcard and error corrected. This is going to be interesting.... I feel a challenge coming on.....Anybody help?

JohnC.

TETRA next week? hehehe :-o)

Banned, no, encrypted yes. Don't take my right to listen to a frequency in a
public medium just because it happens to be a frequency used by cordless
telephones. If the cellular industry had done what the cordless industry had done

and placed labels on cellular telephony equipment from the beginning that stated
that a cellular telephone is a two-way radio communication device that transmits
on the public RF spectrum, we wouldn't have all these senators who obviously
have no clue as to what they're voting for, voting for stupid bills like this
one.
If it's in the air, it's in the clear. You want privacy, use encryption.

>

Sorry, but the police department, fire department, EMS are all PUBLIC services
paid for by our tax dollars. The public has a right to know what it's police,
fire
EMS services are doing. There have been many instances of scannists aiding
the police. One example would be the police looking for a car with a certain
plate. A scannist driving along, hears the police call just as the car they are
looking for speeds past him. So he picks up his cellphone, calls the police
and lets them know he is following the car they're looking for and where
they're at. This is in no way obstructing justice nor is it interfering with
the duties of the police, our public servant.
If you really hate scanners and radios that much, you should probobly
get rid of whatever radios you have, stick your head in the sand,
and believe with your full heart that everything will be OK and such and
such a law is for your own good. Just because the government says so.
Our government is so screwed up that the left hand doesn't know what
the right hand is doing. They vote on issues and pass laws about things
they know little or nothing about. Personally, I prefer to use common
sense than trust our lawmakers. If you want an example, check out
www.kevinmitnick.com and see what the government CAN do to you.
Instead of all this rhetoric, at least look at the other side of the coin
before spouting such nonsense.

I assume that you can write in an alpha tag for each channel along with other infor on each line.

Does the channel that is active get highlighted and move up and down the screen as the scanner hears them?

Anybody got a copy of software for sale for the Mac or PC?

Which is the best program?

It is ironic that US law forbids receivers of
cellular telephones to be sold, manufactured or imported
to the US, meanwhile numerous studies show that cell phones
maybe killers of their users.

Source: http://uk.news.yahoo.com/000404/2/a2vcv.html

Alarm bells ringing over mobile phone study
By Patricia Reaney

LONDON (Reuters) - Alarm bells are ringing after a consumer magazine reported that hands- free kits designed to protect mobile phone users from radiation actually channel three times more of it into their brain.

There is no scientific proof that the ubiquitous gadgets that are becoming an essential accessory of modern life cause cancer or other medical problems.

Medical studies into possible harmful effects of the electromagnetic radiation emitted by mobile phones are continuing and early research has not proven any definitive link.

But the report in Which?, magazine of the independent Consumers' Association, was enough to make front-page headlines and prompt mobile phone retailers to insist their products are safe.

"If you're worried about levels of radiation from your mobile phone, you shouldn't rely on a hands-free set," Graeme Jacobs, the editor of Which, warned in a statement.

"The two models we tested triple the radiation to your brain, though we still don't know for certain whether that radiation is harmful," he added.

The phone shields simply didn't work and Jacobs advised consumers not to waste their money buying one.

RADIATION - HOW MUCH IS HARMFUL?

Which? tested two kits, one from British Telecommunications's BT Cellnet and the other from the Carphone Warehouse, one of Britain's most successful mobile phone retailers.

Which? experts think other brands could act the same.

Carphone Warehouse managing director Charles Dunstone took issue with the magazine's findings.

"We are surprised by the Which? report, as are several of the industry bodies that we have been speaking to, as all other research has contradicted their findings," Dunstone said in a statement.

A BT spokesman welcomed the research.

"The more information there is, the more research, the more informed everyone can be about the potential for risk," he said in a telephone interview.

Antonia Chitty, a senior researcher at Which?, told Reuters the magazine used routine tests to determine the radiation level but admitted standards are still being developed.

"It is a fast moving field," she said in a telephone interview. "We are quite confident that the tests were adequate."

She said their experts suspect the wire from the phone to the earpiece acts like an aerial, channelling more radiation to the brain. They are also concerned about leakages of radiowaves from the socket that the wire is plugged into.

But the big question remains. Is the radiation harmful?

A Finnish study showed that radio waves from cellphones heat the brain, but at very low levels. Swedish research on people with brain cancer found the tumour was more likely to occur on the side of the head used to speak on mobile phones.

The International Agency for Research on Cancer based in Lyon, France, hopes to answer the health question with its five-year study of cellphone users in eight countries that was launched in 1998.

The World Health Organisation is also reviewing evidence in a bid to set a universal standard for cellphone emissions.

Chitty said that all of the mobile phone retailers Which? questioned said their devices met safety standards set by regulatory bodies, even with the increased radiation from hands-free sets.

"They aren't telling us whether their hands-free set increases or decrease the radiation. They are just saying that with or without the hands-free kit they are still within the limits," she said.

"It is definitely possible for some hands-free kits to be designed so they do not act as an aerial in this way. They can be insulated. Our experts are very clear that it is possible," Chitty added.

I figured out what my error was. I was using the wrong trunk mode or type for that frequency. I looked 154.1000 up on the web and it is valid for the Leander PD. I had to use E2-900, entered the frequency and it started searching.

249. CARMA Meeting April 8

Newsgroup: rec.radio.scanner
Date: 2000-04-04 00:00:00 UTC
From: "Rich Carlson, N9JIG" <rich@n9jig.com>
Message-ID: <rich-2B099C.11550004042000@news.theramp.net>
Source record: 90891

The next CARMA (Chicago Area Radio Monitoring Association) meeting will be on Saturday April 8 at Phillie's Pizza, 6300 S. Kingery Hwy (IL-83) in Willowbrook IL.

Lunch starts at about 11:00, and the meeting starts at 1:00 PM. There is no fee except that you must buy a meal to keep from being tossed out of the joint.

Bring any scanner info for the Chicago area as well as radios you wish to sell off and any handouts you want to pass out. Bring you hand held scanner too to listen in on our wireless mic.

For a map and more information see the CARMA Web Site at:

http://www.theramp.net/shabec/carma.htm

Enjoy, and we will see you on Saturday!

Or you could get a Icom PCR-1000. Mine is gapless, of course computer
controlled, unlimited memory channels, band scope, does short-wave and SSB
and scans pretty fast too. With the Talk PCR software its flawless!
Can't touch that with a RS scanner....yet.

I only see the ICFSC1 on J&R, the e-bay item is for a ICF-SC1PC.
Is the ICF-SC1PC on sale at J&R?

They are different items, although admittedly closely related. The -PC
version has the PC interface, a cable and a CDROM.

I think the closest they've gotten is to the curb. That leaves the coax drop into the house which is where most leakage comes from anyway. Al of those Radio Shack connectors and spiliiers I guess.

>trunking type. One says Type 1, Map P12. The other lists a IIi, with
>fleet map E1 P12.

>Does anyone know which is correct?

Actually, neither.

Both the above fleet maps mean the same thing: E1P12. E1 means that
it's a type-1 or hybrid system. P12 means that the first seven
blocks are type-2 and that the last block is type-1 / sizecode 4.

Cobb County finally converted the last of the type-1 radios in the
last block to type-2 back in September or October of last year. Now
the entire county system is type-2, so just use "E2" on your Pro-92.

HELP!

I've bought one of these second hand for £119.99

I have 60 days in which i can return it should i find fault with it .....
My problem is that it doesn't want to reactively tune my aor8200 .....
I've got a lead that doesn't include the voltage converter because i believe
both my scanner and freq counter run at TTL levels
The lead has main sleeve on jack plug connected to ground on scanner
and i've tried ring on jack plug to RXD on scanner
and i've tried tip to RXD on scanner
The scanner is set to 9600
and ID 00
The scout has been set with filter on and off and capture on and off .. .and
all combinations thereof

When its all connected up ....
Turning the scanner on then the turning the scout on lights up the
serial comms bullseye thing on the scanner
If i switch the position of the capture switch on the scout .. the scanner
freq steps up one step (suggesting some kinda comms is working)
if i press enter on scanner to turn bullseye off
when the scout catches a frequency the bullseye will come on again
(suggesting the scanner is aware of the scout)
But it never actually tunes the scanner in
I've tried the scanner in 2vfo mode
1vfo mode
scan and search for good luck .....

Please can anyone help before i have to return the scout as broken when its
probably user ignorance

Hi Dave.

Just curious.....does anybody else have trouble logging onto
this site? I tried it twice yesterday and both times it
totally locked up my computer. The first page would load
about 60 or 70% and the screen would freeze. Hitting the
escape button would not do anything and even control+alt+
delete had no effect at all. The only way I could get out
of it was to completely turn off my computer, wait, and log
back on. I tried it twice with exactly the same results, and
decided to leave it alone.

E1 P12 and Map P12 indicate the same thing, a Type I/IIi hybrid with
the first seven blocks Type II and the eighth a single fleet Type I.
However, Cobb is apparently now a straight Type II, so the question
is moot.

Hello,I have a Realistic model PRO-34 that can be modified easily to
cover
the band in question.I am asking $100.00 shipped to the lower 48.I will
include the information to make the modification.This is a 200 channel
direct entry hand held that comes from the factory to cover the
following
bands.
30-50MHz,108-136MHz,136-174MHz,380-512MHz,806-823.9375MHz,851.1125-868.9375MHz,896.1125-96
0.000MHz.

I am in Brinnon, Washington (Jefferson County). I have a discone
(the Radio Shack discone) up at 60 feet. CATV 50 Ohm cable into
Pro-2066. I moved from Seattle.

While in Seattle, I got the trunking to work. Out here, I cannot hear
the data channels clear enough for the 2066 to scan and lock.

Although I hear the 150 MHz transmissions, etc.

Anyhow, I did scan around, and I hear what might be a data channel at
854.0375 MHz. Who is this? What channel frequencies go with this?

Is there any Trunking in Jefferson County, or close by that can be heard
here in this part of Washington?

Thanks...

Thanks,

285. Diamond D-130 Results

Newsgroup: rec.radio.scanner
Date: 2000-04-05 00:00:00 UTC
From: John LeMay <jlemay@nospam.njmc.com>
Message-ID: <8cgl97$ss9$1@news.monmouth.com>
Source record: 90777
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Just rec'd and "installed" my D-130 and thought I'd let everyone know how happy I am with the antenna. Some may recall my inquiries about this antenna here a month or so ago. The installation consisted of installing the eight radials plus eight (or so) more horizontal elements, attaching the coax and the vertical element, and connecting it to my PRO-2005. The antenna is sitting on the floor of my attic and is connected to the radio with 25' of RG-6U coax, even though the antenna and radio are less than 10' apart. (My radio is in my office, on the second floor. The antenna is in the attic above my garage which happens to share a wall with my office!) No ground connections, no mounts, discones are nice! The antenna is about 5' tall, in case anyone is wondering! I did.

Anyway, using the old weather freq test I could hear only static and a faint voice that could not be understood with the extendable whip (shipped with the radio). As soon as I attached the D-130 the audio BOOMED from the speaker. I actually had to turn it down! Sounded crystal clear! I hit the scan button and after a few minutes I realized I was now hearing several mobile EMS and police vehicles that I honestly NEVER heard with the whip. Prior to the D-130, I could only hear the dispatchers on these freqs.

I consider this to be a really good demo of the antenna, especially since there was a LOSS of antenna height (although only about 2') when switching to the D-130. I couldn't ask for better performance. The antenna is well worth the $130 or so I spent for it and the coax.

While I'm at it, kudos to Grove (grove-ent.com) for the speedy service. I ordered everything on Thursday and it was here in NJ today. I also received email notification from Grove on Friday letting me know that everything had shipped. They even through in the two connectors I needed to adapt the F connectors on the coax to the antenna and to the radio!

DISCLAIMER: I am in no way affiliated with Grove Enterprises or with the manufacturer of this antenna. This "review" (and I use the term loosely) is purely due to my satisfaction with the product and with the service provided by Grove. I am receiving no payment of any sort in return for my comments.

Want to buy some new gear so time to sell the old stuff.

All is one owner (non-smoking), original box, packing and manuals included. Buyer pays shipping. Any and all offers acknowledged and considered. Jpegs available, just ask direct and I'll send them.

Icom R-71A receiver
Cosmetically great shape with no major scratches or dings.
Electrically fine shape with no problems. 12 VDC option included. Only modification is MW attenuator removal. Includes Don Moman's R71A Performance Manual. Asking $500

Icom R-7000 receiver
Cosmetically good shape. One obvious scratch on the topmost area of the front panel, otherwise no major dings. The only electrical problem is in the display, where two of the M ch segments don't light, making M ch '88' look like '00'. Otherwise no problems. 12 VDC and TV-R7000 options included. I will also include a homebrew CI-V interface and data slicer ckt (external devices). Modifications:

-scan speed increase
-custom scan delay board
-198 ch memory
-rear-of-unit 12 VDC cooling fan (no holes drilled and it's quiet)
-discriminator audio available at rear panel 'SPARE' jack

I don't have the original packing or docs for the TV-R7000 unit.
Asking $750

Icom Communication Interface V Reference Manual. CI-V command reference. $10 or included with first above radio sold if purchaser so desires.

Uniden MR-8100A Mobile Scanner
When I purchased this radio new it came in a box labelled MR8100A, but the radio and most of the documentation is labelled MR8100. My understanding is that its configuration makes it the A version so I'll advertise it as that. This was used as a mobile radio so there are some case scratches from the bracket and some fine scratching on the display bezel. Performs great. The cheap plastic bracket for the speaker shattered a long time ago so that isn't gonna be included, but the original programming software, mobile bracket and a programming cable are. Original thumbscrews for the mounting bracket are gone, but replacement screws included.
I had modified this radio to better suit my needs as follows:

-heavy duty coiled DC power cord w/ cig lighter plug
-BNC antenna jack relocated to non-A version location
-1/8" discriminator audio jack installed

$175 firm

I have for sale a Standard C5718DA mobile transceiver. It comes with the original box, manual, bracket, power cord, and the optional 200 memory channel chip. It has had the modifications done for full 800 Mhz receive and CAP/MARS transmit. Used exclusively in a non-smoking environment. $450 shipped to the US.

It never fails. Billy Gates and Co can use about every dirty,
monopolistic trick in the book to add to their *Billions*, car
dealers can add $3000.00 - $5000.00 _over_ the sticker price on a hot
selling car (Daimler-Chrysler PT Cruiser for example) and not too many
in the general public complain. But let Joe Dokes make a few bucks in
beer money or pay for his hobby off of eBay items and people are after
his hide.

Great webpage, Brett! Keep up the good work. You had some radios displayed that brought up some fond memories. I didn't see any "Sonar" scanners, though. Unfortunately, I don't have any pics of them.

Well, it makes perfect sense. I believe that laws need to be updated to fit changing
technology and outdated laws need to be changed. A law should protect everyone

and not take anything away from anyone. We need laws that work, not laws that obviously hurt our scanning hobby.

Well, my old 40 ch Uniden gave up the ghost a few days back. Upon looking at all the new stuff, trunk tracking, etc I got a head ache.

1.) I'm looking to spend no more than $300-$350.
2.) Still not sold on a handheld or base. (are there any tradeoffs in performance in a handheld?)
3.) Just how important is trunk tracking? I get the impression that the larger metro areas have lots of trunked comm. Allentown PA??? Don't want to pay for something I'll get little use out of.

Anything anyone cares to share with me from specific model preferences, given my price range, to specific features, importance, etc. would be GREATLY appreciated.

Thanks

You might want to look into the Bearcat 895 XLT. It is a trunk-tracking scanner, but has quite a bit to offer you as a conventional scanner. The feature I like most is the CTCSS tone capability. If you live in a RF rich environment (big cities usually) you will more than likely get hammered by intermod. The CTCSS tone will eliminate most noise and allow you to listen to the important stuff. 500 channels and quite fast search/scan rates are a bonus too. If you find out that there are trunked systems in your listening area, you will be ready for the action. This scanner will not scan trunked and conventional at the same time (a negative). Good luck with your hunt.

The 895 has only 300 channels.
Stay away from the 895, get the 780 XLT when it comes out.
The 895 only tracks Motorolla 800MHz systems.
The 780 is a wide range radio 25-1300 MHz and trunks all kinds of
systems and it will have CTSS. This radio will run around $350.00.
If you want a TT handheld unit, try the 245XLT or the Radio Shack Pro
94.

Are you sure this is the correct model designation?
I have a UK spec AOR scanner (Model # AR8200)
1000 channels,20 banks, handheld (500kHz-2040MHz continuous)
If this is what you really meant, then you can check out the picture,
details on this UK scanner dealer website.
(BTW, I have no commercial interest in this website.)

<< http://www.javiation.co.uk/ar8200.html >>

One thing though, the factory default settings for the bandplan are
based upon the UK/European assignments. The easiest way to
reconfigure it for the USA bandplan would be to override the
memory and factory pre-sets, via the optional computer control
interface. (nominal additional cost).

I've dealt with this small dealer in England and found him to be, helpful,
efficient and he won't rip you off. He ships worldwide too, but you should be
aware that because of the continuous tuning feature, you could accidentally
;-) tune into certain parts of the US radio spectrum without having to do
any modifications at all. Might not go down too well with Uncle Sam!!

Good Luck!

Ya' know, I 've read through all the postings on this thread, and ONLY ONCE did I see anything that comes close to the simplest fact out there!

So we all get the insidious "black box" radios. We can't screw with them, can't play "image monitoring" can't do anything. Somebody said, "Use the landline". Somebody ELSE brought up the ability of Gov't agencies to place an order for the local telco to monitor the landline calls at the Central Office. Yeah, but it doesn't necessarily happen there.

Delving into the black helicopter theories; I'll do the old "I could be fired for saying this" accreditation; but here's reality: Sometimes the monitoring doesn't take place at the C.O. There's usually a large distribution box somewhere in your neighborhood....all the copper pairs congregate there to be connected to feeder cables going back to the C.O. Guess what, any fool could take the "jack portion" of an RJ11C and attach it to the appropriate screw terminals. Voila, you're on the line. "But hey, the boxes are locked!" Okay, so you're a mildly sophisticated crook; and you don't have a lockpick set? And if the box DOESN'T have a lock - MANY DON'T - does the mildly sophisticated crook have a Harris 216 tool, commonly called a "can wrench"? How about a 7/16" socket and ratchet? Terminals right near the house? Try a little catch called "multiple appearances" - cable pairs that are terminated in more than one location. Clip on to the cable pair somewhere other than at the terminal feeding a specific residence. This is not "secret information" by any means....been out on lots of calls to track down these instances - usually to locate long-distance service crooks; who don't care about whose line they're on, as long as they can call Aunt Edna in West Slobinia on somebody else's nickel.

IN NO MEANS IS THIS MEANT AS A PRIMER ON TELEPHONE THEFT/PRIVACY INTRUSION!!!!!!! If you're larcenous/devious/STUPID enough to try this, I FERVENTLY HOPE YOU GET CAUGHT AND THROWN IN JAIL! It's sometimes my job to help put clowns like you away; and I get some pleasure in that part of my job. What I'm saying is that you can't trust in the confidentiality of ANY conversation that's not face-to-face; in a closed, hermetically sealed, foam padded room (and then, those who have reason to be truly paranoid better check the light fixtures)! And, like gun laws, any "privacy laws" regarding communications are ONLY effective on THOSE WHO NORMALLY OBEY THE LAWS. It's like the old saw about the "Private Property-Keep Out" signs that keep away the law-abiding; and serve to pique the interest of the bad guys. Crooks who don't really care until they get caught won't give a d*** about any other laws they break.

Just think about it.

Jim Allen

326. Sony SC1PC software warning

Newsgroup: rec.radio.scanner
Date: 2000-04-06 00:00:00 UTC
From: Clay Schneider <clayschn@fast.net>
Message-ID: <sep2ob1crfg140@corp.supernews.com>
Source record: 90702
Cross-posted to: alt.radio.scanner,rec.radio.scanner

For the new crowd of SC1PC owners, if anyone has a 333Mhz or faster machine and did not have Foxpro already installed and running on your machine prior to installing the Sony software, you might very well experience an old 'windows 3.1 style' [I'll call it] CLOSE/IGNORE error box when first starting the frequency database application. This problem may be intermittent, or may be 100% repeatable [I didn't see it after the first install, but did see it after the first re-boot]. If you don't see the error box, you probably don't need the following patch. The source of the problem is a Foxpro issue documented in the Microsoft support database at:

http://support.microsoft.com/support/kb/articles/q240/9/82.ASP

The article describes the problem and provides a patch [you will need the international version of the patch to update the software supplied on the cd - 'IPatchFP.exe'].

Unfortunately, since the file to be patched and databases all 'live' on the CD, I have not found an easy way to apply the patch, short of copying the cd to hd [600+Mb], resetting the read-only bit on the file to be patched [foxw2600.esl], applying the patch, and burning a new cd. If you have the disk space, I suppose you could leave the whole thing on your hd and install/run it from there, but that's your call.

Note, if you already had a version of Foxpro installed on your machine prior to the Sony software install, you may not need this patch.

I have seen nothing on the Sony web site regarding this issue.

Hope this helps.

Clay

i was the first to post on here that J&R was selling these scanners for $99 from the list price of $299. Even though I have several excellent fully unblocked scanners, I thought what the hell. well it arrived yesterday and I already have gotten an RMA to return it. There's nothing special about it; it's too big; the volume isn't great. it doesnt come anywhere near my Pro43, among others. luckily i live across the river from manhattan so i can just take it back to the store for full credit. unless you REALLY REALLY need such a scanner forget it! just my opinion.

I just got this radio for 100 bucks. If you ask me , it is all the radio a reasonable
person would ever need.

Unless you are Ted Kazinski , you coudn't ask for a more intelligent design.
It does not trunk track (shoot)
It does not interface with the scout. But day-today, who needs that crap any way.

Unlike uniden, radio shack, bearcat - those radios-for-dummies radios- The sony doesn't skimp on band coverage, leaving you gaps all over the place, but utilizes the band plan in a sensible manner. It is actually easy to use. without cheating you out of frequencies like those old-school, "If they want the TV band they can buy one of our TVs and if they want the air band they can buy a second radio , because we slice up the spectrum in what we think is a way to make us more money", butthole design radios.

It also connects to the PC.

scan speed, a perception of the listener to differeniate calls. Maybe
instead of speed you need a seperate receiver on a specific frequency...

Mike Dickman (KD4LLA)
Fairbanks, AK
new pics at http://www.alaska.net/~mdickman/Index.htm

What is the moral basis for Congress to force any person to set aside a
specific portion of his earnings for retirement, whether it's Social
Security or in a private account?

"Wolf shouldn't be 'sacred cow'

Every single animal that has been professionally managed as a game animal has thrived. The wild turkey was once extinct throughout most of its original range. Now, through the efforts of the wild turkey federation, state game agencies and individual sportsmen, the turkey has recovered.

Radical animal rights organizations and their assortment of humaniacs and little old ladies in tennis shoes have never been responsible for the recovery of a threatened species in this country. If the wolf were managed as a game animal rather than the sacred cow of the bunny-hugging set, wolves would be embraced by sportsmen throughout the country, and they would again occupy their original range."

its pretty basic and unsophisticated, but i tend to go for a real wide band receiver scanner like the wilz, aor, etc that you can get out of europe.

I tend to agree it is a little sad. Not a 'bad' radio, just a little sad -- particularly the squelch which seems to have little if any hysteresis, causing it to virtually always find at least one station right at the point where the audio 'flutters' badly, till you adjust the squelch so it flutters on a different station....

Oh well, I expect it'll be out on the table at the next tailgate sale....

Clay

I converted my print subscription over to the MT Express PDF format.
You get the next month's issue on the 20th of each month, accessible via
ftp from their download site which is password-protected. Content is
identical to the print version, including the cover and all the ads.

And yes, it's a pretty big file for downloading if you have anything
less than a 56k dialup connection, but at 56k it's not too unreasonable
-- you can get ftp programs that will connect and download at
predetermined times so that you can have the download take place
overnight, for instance. Cable modem or DSL is better if you have
access to it, naturally.

i'm not asserting that the spny should live up to any other scanner...i'm just saying it's pretty basic and I was giving an opinion/warning to newbies that they might want to shop for something more sophisticated and flexible...rthere are probably a dozen used scanners on here that for a bit more money are far better options, imho

Although the $100 closeout price is a good deal, I agree with the guy sending it back. The Sony is the BIGGEST, Bulkiest clumsy stupid handheld scanner made since 1974. it DOSEN'T have ctcss or DCS, a must for serious scanning outside the air band! I would gladly sacrafice, for example, the "TV sound" (oh wow, I pee-d my pants) reception for a bearcat SC-200 which is computer programmable, has ctcss & dcs & alpha-numerics, air & 800 & is small enough to really call a "handheld" scanner.

They were just in town and these are the ones I found active:
164.900 (Control)
170.900 (Control)
238.150
275.350

The last 2 are used in flight. One by the group of four planes and the other by the two planes flying separate. When they grouped up with six planes they only used one of the freq. It sure adds a lot to the enjoyment being able to listen as well as watch.

>-- you can get ftp programs that will connect and download at
>predetermined times so that you can have the download take
place overnight, for instance

Or just start the download, then go to bed or to work.
The download finishes, 20 minutes later your ISP hangs up, and
it's there when you return.

Electronic publishing is a real interesting idea, and some day
probably all publications will work this way. The problem for
now is that you have to choose betweeen a huge print job or
being tied to the computer.

I also like the SONY. These guys have a brain in their head.

Give me full spectrum, with easy access to the bands and a cheap price.
Someday these other butt-crap manufacturers will get the message.

Those Bearcat radios are just busy boxes - twist the dials because i can
twist the dials crap. To me they are not hand-held scanners, but butt-held
scanners.

200 Channels, 12 Bands - what a rip off. they control access to the
spectrum band-by-band for no reason except that Mr. bearcat has an old
fashioned tight wad mind set.

NExt we can work on getting scan cat software types to wake up from the
dusts of my bunghole.

They design software to work just like a real radio. What the flip is the
point of that?
They need to make software that gets crap in and out of the radio easy.
That's all . Hello.
I don't need to have to click 3 times to move the big knob left or right.
My radio already does that.
What are they thinking?

OK, I managed to get one before J&R ran out.

Now does anyone know where to set the com port in the software Sony provides? All I get is "disconnected with Receiver".

When I fired up the program, the scanner does go in PC control mode (PC-cnt). Thats about it.

I love the service scans on this radio, especially the button for UHF AIR.

Date: 2000-04-06 00:00:00 UTC
From: cmf43@home.net
Message-ID: <OISG4.22669$Y4.579807@news1.rdc1.il.home.com>
Source record: 90791

I have a mint condition RS Pro-2006 scanner for sale. It comes in the original box with original packing, manual, antenna. I remounted this radio in the Commtel 205 case parts which I purchased from Jonathon at Javiation. The Commtel case is all black and looks much nicer (I thought the RS case looked cheap). I also installed a new backlight in this radio in Dec. 99. The radio works perfectly and has all the standard modifications done to it. I'll e-mail a picture of the radio to you if your interested. Price is $300 delivered to your door (includes shipping / insurance). I will accept pre-payment in the form of a money order only.

To Whomever posted the WARNING Sony Scanner....:

Thank you. I received my ICFSC1-PC today and am very glad to have
stumbled upon this great deal. If not for your posting, I would not
have found about it.

Again Thanks,

Ray

368. PRO2005 BC760XLT for sale

Newsgroup: rec.radio.scanner
Date: 2000-04-06 00:00:00 UTC
From: ghs521@aol.comiamnot
Message-ID: <20000405222602.07256.00001252@ng-cd1.aol.com>
Source record: 90793

RS PRO2005 with OS456 Lite board. Only a couple of mods, a diode is missing, and the power supply has been removed. I have the power supply and will of course include it should you wish to re-install it. Radio runs much cooler with a wall adapter instead of the internal power supply. Display is GOOD, not perfect, but with the OS456 Lite board, the display is not “needed.”
$325.00 I ship UPS to continental US.
UNIDEN BC760XLT with CTCSS board and an AUTOMATED INDUSTRIAL ELECTRONICS TF2 tone finder. The TF2 tone finder is housed in a 760XLT case and piggy-backed on top of the BC760XLT. This is a slick unit for finding tones. $300.00 I ship UPS to continental US.

Hi John,
While I'm not in a position to help, see if you can track down a fellow by the name of Neil Fildes. He has coded the trunker.exe and etrunk.exe programs, and may well wish to accept the challenge. I've found him to be very responsive & helpful. Given that the specs are open standards, that part shouldn't be too difficult at all....

I been using my cell phone for years and not just a couple of minutes a day. I need a solid proof wich iiiiiii ddddoubt "sorry it must be my cell phone that
does this to me" and for your concern they working on a chip that will be placed on the phone or the batteries to invert the effect of the antenna microwave
effect.

As for the law, well cars are legal but they pollute a lot. Why? well its a need not a hobby. So imagine the gov. removing all transportation vehicules,cell
phone, big mega manufactures that pollute with their chimneys etc...
It will be war a real one within the country. I know it's not a funny situation but problems as to be taking care of little by little...

Now THIS is an intelligent assessment of scanner performance if I ever saw one!

The bung hole stuff is a nice touch. You should really consider writing radio reviews for Monitoring Times - the South Park edition.

Do you have something for sale or trade that you would like to post without having to go back to all the message boards that you posted your ad on to see if you have replies to it?

We have a new Swap-Shop message board that will email you when you get replies to your ad, it will let you search though the ad's with keywords, it will filter out bad language, and it will also let you know what messages are new since the last time that you checked the message board.

We hope that this helps you when it comes to selling your item, looking for something if if you are just needing information or help.

Go to the CB City website at cbcity.com and click on the Swap Shop button in the top left hand corner of the page and it will take you to the new Swap Shop Message board.

Thanks, and I hope to see you there.

Dean

Hey JA!

Could you please post or email to me the Fort Worth and Kansas City centers' frequencies. I'm in the middle between the two so hear planes calling both, but doubt I have all the possibilities.
Thanks,
Mark

Source record: 90669

Gregg,

44.70mhz F-1 Base-to-car, car-to-car Paired with:
44.90mhz F-2 Car-to-base

45.22mhz F-3 Base-to-car, car-to-car Paired with:
45.18mhz F-4 Car-to-base

42.60mhz Tactical Base-to-car, car-to-car Paired with:
42.32mhz Tactical Car-to-base

OHP also uses (or has used in the past) the following VHF-high frequencies
as mobile repeaters:

154.695mhz
154.830mhz
154.895mhz
154.920mhz
154.935mhz
155.445mhz

Oklahoma is in the process of changing/updating their radio system and
implementing an 800mhz trunked system. Oklahoma City, Tulsa, and the Turner
Turnpike in between the two are already trunked, but outside those metro
areas the low bands are still in use. What's true today may not be true
next week.
Mark

Hello,

I'm at my 25th scanner since last 10 years. I've owned a Relm HS-200, i bought it because i wanted a CTCSS equipped scanner. But the Relm HS-200 can't search for unknown PL Tones. The CTCSS decoding scheme makes this scanner v e r y s l o w in decoding PL Tones on programmed channels. Slow at the point that this radio was taking nearly 2 seconds to mute "data hiss" transmitted
between analog voice comms on a specific frequency.

I've bought the Bearcat "Sportscat 200": This is THE best scanner i've owned to this date; Very fast scanning and searching, 10 characters alpha tag, very effective
CTCSS circuit, between 12 and 16 hours of use between recharges, much better reception in the 162-174MHz range, compared to the R-S PRO-90, the Uniden BC235XLT or the BC245XLT (wich all are less sensitive in this range of freqs, mainly because of their stock antenna). Someone said somewhere that the SC-200 has the same antenna as the BC245: Maybe in first look, but i'va had the two radios
side by side and switched antennas, and the SC-200' antenna definitively is superior than the BC245' one, in this 162-174 range). And finally, the HS-200 has one bizarre way of programming, very ackward to a Uniden / Bearcat / Radio-Shack long time user (something relating to Uniden's programming technique being "copyrighted" or that kind of thing).

- Sylvain.

Clay,

I don't have a Sony SC1PC and I wish I was able to have got one for a $100. There aren't too many radio out there in this price range that:

a) cover the 225 - 400 MHz band.

b) Provide you with the option toswitch between AM and NFM in the 225 - 400 MHz band.

About the closest that I can think of in this price range is the BC895XLT (and I have one of them). It's about $200 and it does have the mil air band but it does not have NFM capability in the milair band. That limits your ability to scan fltsatcom. I currently don't have the capability to scan fltsatcom but have been interested in doing so. I don't know everything it entails but at $100, the SC1PC would have allowed me to get my feet wet.

Trunk tracking is not a big factor for me because I already have a BC895XLT and a BC245 and there isn't a whole lot of TT stuff in my area. My 2 cents....

Yes CTCSS and PL are the same subaudible tones that open a squelch. DCS is similar but instead of subaudible tones uses a digital signal. Allows for up to 1000 codes in most systems vs 40 +/- for PL.
Also harder for intermod to open squelch.

418. I'll pay for a copy of a Regency scanner schematic !

Newsgroup: rec.radio.scanner
Date: 2000-04-08 00:00:00 UTC
From: theshearers@worldnet.att.net
Message-ID: <38EFC26A.E81FA9FC@worldnet.att.net>
Source record: 90497

I'd like to get a schematic for a Regency ACT-R20/6.

This is an old 20 channel scanner with 6 bands,
crystal mixing, lots of jumper wires inside, etc.
I have figured out the mixing scheme. I'd like to
have a schematic for repairs, mods, etc.

Some technician in this newsgroup must have documents
for this radio or even one of the related series of
receivers. I'd appreciate it if someone could scan and
email me the schematic. Or I could send cash for a full
manual photocopy.

Are there any secret websites? I have searched but found
only owner manuals, no schematics.

Thanks
Tim (Please reply to group and direct)

They only want to unblock their scanners because they aren't supposed
to unblock their scanners. It's part forbidden fruit and part
node-thumbing (or middle-digit-flipping). Very few people actually
listen to cellular calls.

As for what the general public believes, they believe whatever the
mass media tell them. :(

By all means do it...save a tree. You'll get the same
information
and you can selectively print what you want, and read it
offline anytime.

The only problem for me is that I really want to hold a book
when
I am reading. Reading a magazine off a computer screen just
doesnt
seem right.

422. Re: Ghosting?

Newsgroup: rec.radio.scanner
Date: 2000-04-08 00:00:00 UTC
From: tos-tng@startrekmail.com
Message-ID: <38efc5d2$0$25411@news.voyager.net>
Source record: 90501

Ghosting - In computer terms is the copying of a digital image of a hard drive to another hard drive producing two identical hard drive images. Also known as "image casting" to those in the networking field.

Ghosting - In Telivision terms is the same received image on the screen reproduced several times from reflections off buildings, mountains etc.

Image Freq - the same transmitted signal received at different frequencies on the receiver due to poor design in the converter section. Cheap receivers have many images as opposed to expensive receivers which have almost no images. Usually the images occur at different submultiples of the 1st local oscillator freq.

Cloning - In scanner terms is the reproduction of one scanners total memory bank content to another identical scanners total memory bank so that the result is two scanners containing identical memory bank programming.

.................enough of this for now....tomorrow we'll continue with the concept of why there are differently designed keyboards on telephones and cellphones as well as between different scanner models in a manufacturers production line and why they don't just make a scanner with a large display that can be programmed to have the different keys.....................

Just rec'd my Sony Wavehawk. After about an hour I almost threw it out, but I may change my mind now that I've played with it for a while.

Anyway, I was wondering if anyone had access to schematics or and interesting mods or other software for this scanner. I'd love to be able to work some of the features with my laptop via Linux. I'd also be interested in "fixes" for the squelch, any scan speed increases, etc.

Try my Features page:

http://www.strongsignals.net/htm/features.htm

And most of them, when put into Weather Alert mode, can NOT be used
to do anything else while doing so. So you either use it as a weather
radio or a scanner but not both at the same time.

Strong Signals,
Rich Wells N2MCA

I have an almost mint condition (few VERY light scratches from normal wear)
Pro-43 for sale.
Model 20-300
Serial # 002761
No date code sticker
Has NOT been modified (but can be :-)
Face looks VERY new with all fresh lettering, display, and backlight
This is the one you want.
No manual, but original rubber duck, and telescoping optional antenna.

$165 shipped OBO, or trade for an HTX-10 + cash

73,

Gary K7MHZ

No you cannot change them. You need to buy a direct entry programmable scanner. The 350 is a hybrid beginner type scanner made for people who shop in Walmart, preprogrammed with over 700 frequencies in the police band alone, even at its awesome speed of 100 fps it still takes 7 seconds to go through the entire band. If you could program the entire 700--just those preprogrammed in the police band--you could double the cost of this scanner. By the way it is a great scanner, picks up lots of stuff my other advanced scanners like pro-43 don't get!

You can get a service manual from Radio Shack website. Order it with the keypad and save on shipping costs.How did you get it taken apart to check the keypad? Did you unsolder the antenna wire? This is the hardest scanner to take apart, about 3 different levels all wired and soldered together, no wonder it is so small.

oh horse hockey, handhelds are crap! they have speakers less than 2 inches
and they can't be turned up louder than the noise of a car running. the
buttons are extremely small and hard to finger especially if you are
driving. laying the thing down on the seat or on the dash both are the worst
position for the antenna to pickup signals, plus an invitation for it to
fall off during a quick turn and bust it up. the batteries or battery pak
runs down at all the worst times usually after just a few hours of use. the
displays are tiny (pro-43) and the light behind them only lights up when you
push one of the tiny buttons, sometimes you have to hold the button-and you
still can barely read the display (pro-43) where most any mobile unit has a
good light always on.

The reason the Thunderbirds Commander (Lead) asks for permission to start the show is that they have a ground show, where the Blue Angels do not.

Hi,

Hmmm .. So what will they want next? To come
into ones home and check the Scanner? .. hehe.

I almost got put off the road by a man driving
and talkng on his cell phone. But that always seems
to be ok.

Too bad they think we all want a scanner for the damn cell coverage.
The big question is - Can they convince the public into believing that we
only
want a scanner for listening to cell phones?

Also, Will they ever be able to convince the public that scanners must go
and their cell-phone conversions will not be heard by anyone, anytime,
anywhere, anymore?

I know a fair amount of people who will not use cell-phones and state they
"never" will. I think the trust in cell phones went out the door a long
time ago .. If they ever was any. I don't believe it will ever gain the
full trust of the public as far as saying anything really private. Scanners
or no scanners.

{ Mirror Mirror on the wall who is the biggest eavesdropper of them all?)

Your thoughts ..

All the Best!

Mark

> levels all wired and soldered together ...

Actually, there is no need to unsolder anything. After placing the radio face down and removing the case back, take out the six screws in the exposed board. Pry apart the connector at the bottom left between the top and middle boards. With the top board now slightly loose, wiggle it first left, then right, to expose the two screws at the bottom of the second board. Removing these will allow you to lift out and 'fold' over the top two boards as a set (there are two connectors between the second and third board which have to be pried apart). [Credit Howard Bornstein for the procedure.]
When the third board is unscrewed you'll find the key membrane under it.
The replacement part is

"Key, Top", Tandy Part No. KC-0385, Mfr's Part No. GE-91C-9212

and cost $3.89 in 1993. The service manual was $6.35 back then, but you can figure 3-4 times each price today, if they still have the items.

If you can get the keypad(they weren't available a while back,and I sent out of the county(UK)for them),it's pretty easy to do,I've done at least 25 keypads,maybe as many as 40.There's another post where they claim you can do it without soldering,but I have done 25 keypads,maybe more,I sure as hell wouldn't do it without soldering.ANY competant tech should be able to do it for you,IF you can get the keypad.If you don't know what you are doing,don't try it yourself,that's how I got my "parts" 43.The owner destroyed it by trying to mod it without soldering,and broke a board in it,he bought another one,and I traded him some repair work for the old 43 he ruined.With the other junk 43 I had,I put the two together,and got one working radio,and one "Parts" 43.

Good Luck,
Barry

simple, braille type markings on all buttons, and tones and vocal
announcements to tell you what normally would be displayed on the screen,
like a button that would announce the present mode and frequency, etc.
Scanners will all be like this in the future, including voice commandable
with no buttons.

For a BC245, I'd say it's about the best I've seen, overall. It's really not THAT much better than the 5 or 6 others, out there, though, and it's 60 bucks, no electronic shipping (they send you a disk via snail mail). A FREE program that gets the job done is BC245INT, available at http://www.iquebec.com/senss/

True, OR you can just print out the part you want to read "offline" -- I
do this with the SW broadcast schedules from the MT Express issues each
month, and put them in page protectors in a binder to go with my 2010
when away from home. Otherwise I just read online or print the
individual article(s) that I want to read in the john or whatever. ;-)

Cross-posted to: rec.radio.scanner,alt.radio.scanner

I would like to try MDT monitoring using my Optocom receiver. I have downloaded the MDT Monitor program and have connected the discriminator output from the Optocom to the Line In jack on my computer. So far I have not been able to decode any signals using known MDT frequencies. I can hear the signal and the progarm indicates that it is geting a signal but the program does not decode it. I have tried reversing the input polarity and changing the sample rate but nothing seems to work. I assume there is some fundamental mistake I am making and would appreciate any help from anyone who has successfully used their Optocom for MDT monitoring.
Thanks

Actually, one of the older crystal sets would work well. Granted they don't have trunk tranking or (at least that I know of) 800mhz...but if what you need to monitor is VHF or UHF, most of them just had plain old switches for choosing channels...

465. Ant to Scan: Distance Question

How far can one safely (without signal degradation of significance)
mount their antenna from the scanner itself? I am going to an external
antenna from the attic mount (to gain addtl height) and the best place
for me to mount to the house will add some distance between the antenna
and the scanner from it's current location. Any experience will help.

BTW, I will be relocating a ScanTenna from Grove and adding a discone
for another scanner to the mast (if this makes a difference in your
answer)

Hello,

I have Stainless Steel element Discone antennas up on a eBay Dutch auction for $29.95. These are not only great wide-band receive antennas, but are good for Transmitting in the Amateur 144, 220, 440, 900, and 1290 MHz. bands with a SWR of 1.5 to 1 or less.

The Auction ends 3/26 9:05 pm cst.

They're at:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=288216365

This is a Dutch auction, which means no worries about being outbid at the last moment, or the price sky rocketing because of bidding wars. You bid, you get one!

Be sure to check our other auctions and website for other great deals on Scanner, CB, and Amateur antennas.

Thank you

What gets me are those cell users that forget the fact that they are not talking on a wired medium. A crook could monitor the cell frequencies and gather lots of nice goodies to use, like credit card numbers, addresses, phone numbers, names, trade secrets, etc, etc. No limit. Whatever one talks about over a wired phone, they also talk about over cell phones. Dummies.

I honestly do not think they need to worry about people monitoring their conversations though. They need to worry about Uncle Sam evesdropping on their private affairs. The FBI I believe, has filed a petition to allow for more evesdropping with better technology. "Big Brother" is just around the corner.

If they can tell if you use cream in your coffee from 240 miles up, what else can they do? Be very careful with technology. That is a warning to the general public.

Do you also see how the Government wants to "control" the Internet? Bill Gates wanted to own it. It will never ever happen, but watch for new laws making it a crime to do some of the things we can do freely now. Many will be looking for a foreign ISP.

You have to play around with the volume on the sound card. It took awhile for mine to work also and I got frustrated. If after playing around with the settings you still cannot "read" the signal, you probably do not have MDT capability near you. Do the police cars you see in your part of the woods have notebook computers mounted next to the driver? If, so, MDT is possible. If not, you probably don't have a chance.

It's fairly new technology and very expensive and only the larger police departments can afford it.

But, when you start reading instead of listening, it opens up a whole new world of monitoring. You see EVERYTHING on your screen, all the minor details of a person, police records, traffic records, all kinds of stuff.

Keep playing with it. There is no magic solution.

Hi All,

Can any of you recommend or point me in the right direction to find scanners that have the Weather Alert feature, where a siren/alert goes off and the scanner tunes to the Weather frequency when a warning or watch is issued?

I've heard that the BC144XL has this feature. Are there others? Does the feature work?

Thanks!

The other problem might be that they are using a 9600 baud protocol; most
of the MDT programs out there can't deal with some of the newer protocol
routines- only the 4800 buad variety....73s Mike ka3jjz@erols.com

Essentially no scanner made after April of 1994 can be modified for
cell. There are a few exceptions like the early Icom PCR 1000's buy not
many more. You will need to go abroad or earlier than 1994 to get a
cell capable scanner.

The Radio Shack PRO-94 handheld scanner has a built-in weather alert. I've never had my PRO-94 tuned to a NOAA weather frequency when the alert feature was activated, but the weather alert works well in the test mode.

Well I know that a major U.S.A. radio retailer, wholesaler, and repair facility in New York City, will NOT service Yupiteru radios because:

1) lack of parts;
2) lack of service info/manuals
3) NO support from manufacturer
4) poor reliability, new or used or repaired

Yupiteru radios especially the MVT 7100 is one of the finest handheld scanners you can buy. The reason that "a major U.S.A retailer in NY city will not service them is because they are illegal in the United States because they are unblocked scanners. We have no problem servicing them in Canada. Check out the various scanning clubs around the U.S and you will find that jimbo is not telling you the truth!

It depends on your definition of "military frequencies" -- most
scanners these days don't include military *air* frequencies in UHF.
Only the "full coverage" units include that band any more. The last
Radio Shack unit that had it was the Pro-60, if I recall correctly. I'm
not sure I'd call the VHF frequencies "control" though; they were
maintenance frequencies when I monitored them. The Thunderbirds do use
a control frequency though -- I think the command structure is a little
different for them. With the Blues, the lead pilot is in control. With
the Thunderbirds, lead asks for permission to start the show. At least,
that's how it seemed when I was listening.

I just found this great deal on SONY IFC SC1PC. I bought 20 of them because they can hook up to my pc. WIth a little techno wizardness, i am able to string them all together in a network, each playing a different channel at the same time.

The instructions are in the Maintenance manual for SONY IFC SC1PC for around 65 dollars.

Now I have been able to employ trunk tracking because each radio can monitor a different channel in the trunk, and when a channel is open, i can make the other 19 radios go silent, or switch to a different frequency.

My dog urinated on one of the radios, and now the whole string is down. I need to go radio- by-radio and see which one is the faulty one. I used my christmas light tester on each point in the network, and discovered that the wet one was actually working, and it was the first radio in the string which was sending broadcast messages throughout the network that it had performed an illegal operation and had been shut down.

Now the whole system is fine again.

As a blind person I know exactly where you are coming from. It is extremely difficult to memorize each of the channels and the frequencies they contain. And if you are anything like me , you have flippers for hands which makes the whole thing 10 times worse.

Icom makes a scanner with only one channel and it is extremely easy to use for this purpose.

Here is a list of the pre-ban scanners of which I am

aware that should be capable of frequency restoration:

PRO-2004 BC-855XLT *3 Regency 4030

PRO-2005 BC-200XLT Regency 1600

PRO-2006 BC-205XLT Icom IC-R10 *7

PRO-2022 BC-760XLT *4

PRO-2026 *8 BC-700A *3

PRO-2027 BC-890XLT *4

PRO-2030 BC-950XLT

PRO-2032 BC-2500XLT *3

PRO-34

PRO-37

PRO-39

PRO-43 *1

PRO-46 *2 *5

PRO-51 *6

PRO-23 *6

Note 1: Date code of 2A4 (Feb94) and prior, any xA3, any xA2 (label in
battery
compartment), or no "A" in the serial no. (Date code 3A4 (Mar94) and after
WILL
NOT WORK !)

Note 2: Date code of 2A4 (Feb94) and prior, any xA3, any xA2 (label on
back).

Note 3: Date of mfg code must not end in the letters "ID" or after. (ID=94),
except for OAID (Jan94). (On BC700A some "OBID" (Feb94) work)

Note 4: Date of mfg code must not end in the letters "ID" or after. (ID=94)

Note 5: Units with date code of 5A4 (May94) can tune the restored
frequencies
in 30 kHz Steps using a keyboard entry sequence after a wire on the "newly

attached" daughter board is snipped.

Note 6: Units with date code of 6A4 (Jun94) and prior (and some 7A4) can
tune
the restored frequencies in 30 kHz Steps using a keyboard entry sequence.
After
date code 7A4 (Jul94) no mod can be done.

Note 7: The current 1998 models are. New reports say Icom is now only
importing non-modifiable versions.

Note 8: Model (catalog) number with "B" at the end not modifiable. (Reported
no
L201 jumper on the circuit board)

The below list are those scanners that were capable of receiving the full
800
MHz band,

without modification:

J.I.L. SX-400 AOR-950 Icom R-7100 *

Regency MX-4000 AOR-1000 Icom R-1*

Regency MX-5000 AOR-1500 Icom R-100

Kenwood RZ-1 AOR-2500 Icom R-9000

Uniden BC-800XLT AOR-3000 * Icom R-7000

Yaesu FRG-9600 AOR-8000 *

* pre-1994

take out your batteries and look up in there, 2A4 or earlier should be modable, dead giveaway is if the front says Realistic it is modifiable, they changed the name to Radio Shack on the cases in 1994 about the same time they made them hard to unblock.

[..]

As was pointed out, there is optional trunking software for the
WinRadio that will do this. (See www.winradio.com) The Winradio
software decodes the data channel using the audio output of the
scanner and a soundcard. No data slicer is needed. The software can
use either one or two WinRadios. (It works fine with one WinRadio
card.) Unfortunately, of you want to use this software, you need to
get the WinRadio hardware....which is fine also.

> answer)

This depends on what type of cable you are using, what it's rated losses are and what it's length will be. Then it depends on how much you will tolerate.

If you go to the manufacturers web pages (Belden for example) and look up the loss figures for the coax, they show several figures. They show a loss in decibels per 100ft at 100MHz, 450MHz and 1000MHz for example. You can guesstimate from this the loss likely to occur at the frquencies you are most interested in hearing.

So, if you find that you have 50ft of coax with 6db/100ft loss at 450MHz (3db loss) and an antenna with 3db gain attached to the far end, the system loss is 0db at 450MHz. this is a good deal, and there's the huge benefit of antenna height so the system wins.

The bigger/higher/stronger antenna will generally pick up a much stronger signal to begin with, so a few dB losses in cables won't matter. this isn't meant to be a treatise on the subject for out there who get supercritical about details, just a general guide.
the basic rule is to use good coax.

At my location I am using a 146MHz 1/2 wave vertical antenna at 30ft. It is fed by 40ft of RG213 then 30ft of Belden computer coax. I don't even care about the losses. I can hear FM signals from 28MHz to 36MHz from Asia and the USA and it works just fine for me at anything up to 1300MHz, as well as tuning around on HF using my R10.
Actually, it overloads the R10 on HF.

using either a undien 235,245 or a radio shack pro-91 or pro-94
trunktrackers you should be able to still tune them in, but only if
they are operating a analog system-if it si a motorola digital astro
system like the state of PENNSYLVANIA(my home state) i my self have
been told i will be inpossible to tune in until they come out with a
scanner able to decode digital transmissions(unsure when and if that
will happen soon?)if you need info on 800mhz try www.strongsignals com
for info, they should have what you need to know-hope this helps.

http://www.scannerworld.com sells scanner pre-amps for both portable scanners and desktop scanners. I'm thinking about one myself just for the hell of it. So if you have long coax runs and signal loss, one of these babies just might be strong enough to pull in your losses.

could be the antenna connection at the circuit board, this is often a stress point as the antenna mount gets a lot of twist action and loosens up, then the connection inside the scanner starts getting the action until it opens up.

use rg6 if it is less than 100 feet. Good price and strong signal. Don't use any adapters or splices, or excess wire length you don't need. Next step up is rg8, lots bigger, harder to run and hide, much more expensive, and rated about the same as rg6.

I only had to buy four. I attached them to my lionel train set and I sit in the middle of the circle. Couldn't ask for a better surround sound trunk tracker deluxe. Make sure that you rivet them so that if the dog has an accident you won't ruin the glue. Since you probably only have a week until the martians come, I think this is a perfect way to stay informed and relax. Don't forget to cover the window with aluminum foil incase hale bop does a reversal, and by all means wear clean undies.

510. Need help changing crystals in Motorola Minitor II pagers

Newsgroup: rec.radio.scanner
Date: 2000-04-09 00:00:00 UTC
From: station_3@hotmail.com
Message-ID: <38f11f1e.22796125@news.erols.com>
Source record: 90526

I have two minitor II's which I want to change the frequencies on. They are both UHF. The pagers are now 1 frequency on both channels, I want to make them two different frequencies. I have obtained the necessary crystals, but when I went to change them I noticed there is a red type of knob (sorry for lack of better description) which has a screw slot and appears to be a type of tuner, next to the crystal. I have another pager which is already two seperate frequencies and it has the red knob next to both crystals. Do I need to get two more of these as well for the other pagers? Or can I just put both crystals in with only one of the red knobs? If I do need to get this part, where can I get it? Thanks!!!!!

I have a Bearcat 895 XLT that has that feature and emits an ear-piercing
siren when the weather alert mode is enabled. Works well.

Which is a really dumb feature as implemented as indicated by Rich Wells. I have a cheap CB with WX alert and it works without even having to turn on the radio! It also works regardless as to which CB channel you using if you have the radio on.

The first time I heard it, a loud alarm triggered by the tone, I was scanning insturments trying to figure out what critical system had malfunctioned in heavy traffic. I never thought of the Cobra CB with WX alert as it was turned off.

Don't waste much money on this feature, you can get the weatherradio at RadioShack on sale often for about $20, but you will soon find out the feature is worthless...the alarm goes off in the middle of the night every time it rains, "threat of severe thunderstorms", and when a tornado landed in Georgia and walked to us 150 miles, no one noticed!

Source record: 90533

Just order a new keypad for it, I paid under $10 CDN for mine and you do not need to un solder anything to take this radio apart, if you look at it you can see all the screws that need to be removed on the middle board, you have to remove a screw on the top board so yo ucan bend out a metal shield under it so you can get at a screw on the middle board, once all these screws are out you have to unplug a few wires that got to the keypad and then the whole top of the scanner will unplug from the keypad part, then you just have to take out the screws and replace the pad and put it all back together.

Cheers

Len

Definately get a base unit with a roof top antenna, you never know what you are missing till you do. Then you can compare your handheld to it. The handhelds have speakers about 1 inch in diameter while the base and mobile units have 3 inches or more. Handhelds are great for carrying around with you in mall and everywhere, but it is apples and oranges, sure wouldn't want to be limited to a handheld. Before you worry about trunking find out what the police and fire use in your town and county. Don't pay all that money for it if you don't need it, kinda like buying a boat while living in the middle of the desert. Go here and find out what frequencies are active in your area:

I just purchased and installed the one advertised on eBay for around $48.00
It cost me $58.00 shipped and is a really nice antenna. Heavy duty
construction and really pulls in the signals. The Low band reception is
excellent.

All,

I'm looking at an auction on eBay for a refurbished Uniden BC278CLT and one for a used BC890XLT. I want it for listening to my local (not trunked) police/fire/ambulance, as well as the weather alert feature.

Anyone have an opinion on these models? Both of these auctions end later this afternoon and any feedback is appreciated!

Thanks for reading my post.

PRO 2021 200 channel base/mobile scanner, with mounting bracket/hardware,
screw in antenna, and manual, NO box. Has attached AC cord, and will
include DC (lighter plug) cord. Display light works fine. No mods done -
works and looks good.
Asking $100, including shipping.

If you have any questions, or are interested, please e-mail me.

I've used and STILL have my thru-glass antenna.

I know of several people who use this antenna and ALL report good coverage, they're ears are also in A1 Condition.

Two of these guys use it for along with their Ham set-up.

Perhaps the problem lies with your receiver or the operator.

As to your problem with handhelds, I have one in my car, back light stays on .....indefinitely (AR8000).

Buttons are easy to press (personally I don't adjust it while I'm driving, it is an offence after all :0))

I have an add-on speaker positioned just above my sun visor and I can hear it quite clearly.

I'm afraid its all in the preparation.......

Have fun guys.

It sounds like you have a com port problem, NOT a scanner problem.
Connect something else to the com port and see if the puter will
recognise it.

528. General Question on Digital Technology

Newsgroup: rec.radio.scanner
Date: 2000-04-09 00:00:00 UTC
From: "Michael B. Tinsley" <mbtins_nospam@mindspring.com>
Message-ID: <8cqc3loui1@slb2.atl.mindspring.net>
Source record: 90544

All:

After not really using my scanner for quite some time (since I have recently moved and have only recently taken the time and trouble to find the local frequencies) I got to thinking about the future of the hobby. My main concern is a migration to digital transmissions. Do you think it will be the death of the hobby?

The introduction of trunking technology made scanning a little more difficult, but new technologies in receivers have pumped some additional life into the hobby. However, just about everything is going digital (TV, Phones, Satellite, and probably commercial radio sometime down the road). Yeah, it makes sense from a bandwidth perspective because we can cram more and more into the same amount of space. And with more and more wireless technologies coming to the market each year, bandwidth is at a premium.

Do you think that we will ultimately see all public service frequencies go to digital systems? Perhaps even by FCC mandate? I know that there would be a considerable cost in doing this -- especially for the small towns and cities -- but if we want to get as much bandwidth as possible, it seems inevitable. If that happens, is scanning public service dead?

Your thoughts...?

Mike T.

529. Re: ICOM IC-R2 FEEDBACK?

schertzer@ns.sympatico.ca (David M Schertzer) writes:
>Seen one today and wonder if anybody has one?
>In CANADA we have the UNBLOCKED version 500kc-1.3g NO GAPS

I have one, and think it's a great radio for the price.

My only real complaint with the design is the "FCN" button. Many
of the functions of the radio require you to press and hold this
little button on the side of the radio WHILE pressing another button,
or turning the knob. You can't pres FCN first, then operate the
other control. This means you can't operate the radio with one hand.
FCN is also very stiff - I soon get a sort thumb if I press the button
with the end of my thumb (so I've learned to use the first knuckle
instead). Icom really could have done better here.

The other fundamental tradeoff is that there is no numeric keypad to
enter frequencies directly. This allows Icom to put in a rather
large speaker, essentially the full width of the cabinet, so that
sound quality is good. (I've heard that the Yaesu VR-500, which
does have a numeric keypad and thus a tiny speaker, sounds much worse).

For scanning memories, or just listening to a single channel, this is
no problem at all. Entering a few frequencies isn't bad either - there
is an "acceleration" function which increments the frequency by larger
steps when you turn the knob fast, plus pressing the FCN button increments
the MHz digit directly. But for entering lots of frequencies, you *really*
want to use a PC and software.

Also, note that the R2 is more "ham radio" friendly than most scanners.
It inherits a number of features from its Q7 cousin. CTCSS decode is
built in. It also has a "repeater offset" for each memory channel.
When this is programmed, and you press the squelch defeat button,
the radio switches to the repeater input frequency instead of the
output.

Hey Folks,

Need some help, what is the all 'round best mobile antenna for 30Mhz to 800Mhz continuous coverage. Tried the strongsignals page but not much info there on mobile antennas. Any info would be much appreciated.

73,
Chris

> inevitable. If that happens, is scanning public service dead?

There are rural areas still using VHF Low band for public service. I think that only an FCC mandate would make some of these operations change, because the radios, as they exist, are serving their purpose.

On the other hand, in urban areas where trunking has been put into play, I think an ultimate move to digital is inevitable. I don't however, think it will mean the end of our hobby. There will still be users of digital radio systems whose reason for going digital are for decreased bandwidth, not for security. These users might not encrypt their throughput.

Of course, it is highly likely that any such system would be trunked.

I do worry about trunked systems (digital and analog both) in event of verious sorts of emergency. What happens if a the repeater/network/power/whatever gets knocked out? The rural systems like I described three paragraphs ago will still be running. This should be a vital consideration in public service.

Of course, it is probably possible to build a VHF Low-band digital simplex system. It would have to be direct or TDMA, any form of spread spectrum would be a b---- at those frequencies to keep the antenna tuned....

No, the Com port is there, I am just trying to find out what settings are suppose to be there. I am suprized that with those who have thier scanner working on thier PC, they can't go in thier pwn port settings and read to me what they have so I can , perhaps try the configeration. (Anything is better than nothing)

I have tried to call Sony Support and each dept. seems to be "passing the buck" to the OTHER dept.
(I'm getting the run-a-round)

haha....no, I didn't buy my PC from a dealer. WHy would I pay for someone else to put a computer together for me
(and make THEM rich)

Anyways.....Windows does see it ....it is just that I'm trying to varify what might be int the COM Port setting from someone else who has thiers set up and working.

Steven

Good condition. Very clean. A few scratches but works perfectly. Bright backlight. No box, copy of owner's manual from Radio Shack site.

Price is $225 plus shipping

543. Re: PRO-2052 - Can it be modified?

Newsgroup: rec.radio.scanner
Date: 2000-04-09 00:00:00 UTC
From: hingram@ame1.tds.net
Message-ID: <38f104a1.84456025@news.tds.net>
Source record: 90559

No, it is not modifiable without consequences.

Why are cell calls so damn important to even listen to anyway?
Why were cell phones even invented?
It is so rude to talk on a cell phone when someone is with you that
you want to talk to so damn bad, then turn around and pick up that
damn phone and talk right in front of that person.
I don't care if you think that they won't mind!!

Get Back To The Basics!!
Get A Life -not someone elses.
Besides you probably wouldn't like what was said about you to begin
with -even if you don't care.

Wayde wrote about having a supplemental speaker in the car for his hand held scanner. I bought a CD adapter for $19.99 from Rat Shack which looks like a tape cassette and inserts into the tape slot of the car radio. I plug the other end into the scanner's head phone connection. This results in the scanners sound output going through the cars regular radio speakers. In addition, I can control the volume from either the scanner or the car radio, and I can use the radio to control bass and treble. Works great and I have no extra supplemental speaker to deal with.

Chris,

I use a Hustler mag mount that as I recall, is meant for 30-900 MHz.
Unfortunately, I don't remember the model. It is pretty good across the
entire frequency including the 30-50 Mhz low band. Cost was around $30.
This isn't a lot of information but I hope what little it is helps.

you can download the owners manual at
http://www.uniden.com/docs/service/supportdetail.cfm?item=SC150Y and as
far as the cell phone coverage...sorry..imaging is the best your gonna
get. All newer model scanners are controlled by the CPU so that UNBLOCKING
the cell phone range is not an option anymore. I have one of these myself
and I LOVE it. Had it for years with NO problems whatsoever. The cell
phone imaging on mine is just like listening to the actual frequency. They
even bleed over on a local sherriff's department frequency I listen to
from time to time.

JB,
Go to the channel you want to program (HOLD, channel nbr, HOLD), enter the frequency you want on that channel, then press "E". Press "DELAY" if you want that, then you are done. Be sure to use the decimal point if you are entering a lowband freq, ie: 29.0mhz to 54.0mhz.
No mods available.

Gee.... I dont know Stephen. You hand built your computer and I bought my Packard Bell Pentium III 450mhz from a computer shop. Your serial port is not working and mine works great. Now why do you think I did not build my computer?

I suggest that since you made yourself rich by building your computer you spend some of that wealth at a computer repair shop and let some one who knows how fix it.
What is that saying about the last laugh?

For about ten years I've been using the Radio Shack mag-mount mobile scanner antenna (part # 200-0032; it's not in their online catalog, but the "support info" is, at http://support.tandy.com/support_electronics/doc52/52829.gif)...the one that's about 36" with two "loading coils" along it. Does an adequate job on all bands, especially the hard-to-please VHF-Low and 800 band. VHF Low band (25-56MHz) is always the band that suffers whwn you don't have enough antenna length, but it does pretty well with this antenna. Costs about $30...magnet is fairly strong, just be careful not to scratch your paint if you move it around.

I've even used it for transmitting on 2-meter and 440 MHz ham frequencies with up to 50 watts. Probably not a great idea, but it worked just fine.

I'm adding a page on Loyd Sigmon's "Sigalert" system, to my site on the history of L.A.P.D. Communications
< http://www.snowcrest.net/marnells/kma367.htm >.

I have yet to determine
exactly what tone was used to activate the receivers, how many radio stations had them, and so on.

If anyone has any information, especially on the early versions and its development in the 1950's I'd appreciate hearing from you. Or anecdotes, pictures, reminiscences about Loyd, his WWII service, etc.

I've been in contact with Mr. Sigmon's family already, and received some assistance from them.

Any help will be appreciated!

First of all good job at putting your computer together yourself, Stephen. Second mine works fine from my laptop but I can't find anyplace in the program to configure the com port that it uses. IA had the scanner hooked up when I installed the program and it just worked. Sorry I can't be of more help. Perhaps your cable is bad or the scanner is bad.

Stop flaming the guy for being smarter then you Willie Boy.

You must have a trimmer cap (little Red knob) for each frequency that you have. Also you have to unstrap the channel 1 crystal so that channel 2 will work.

Good luck and use the other one for a example.

I love it when someone who has windows and 3 other applications on his computer with no plans for it other than replacing it in about 6 months brags how well it works.
If your computer is working perfectly maybe you are not stressing it out with that browser and the freespace game.

562. TV Antenna For Scanner???

Newsgroup: rec.radio.scanner
Date: 2000-04-09 00:00:00 UTC
From: Nick Bergthold <nbergthold@yahoo.com>
Message-ID: <sf2glsv1cqv74@corp.supernews.com>
Source record: 90578

I want to hook my scanner up to my big TV antenna on the roof for farther range. With the right adapter, would this work? Where can I get a RF -> Motorola Adapter? Somebody said I will only be able to pick up certain frequencies. Is this true? How can I have limited frequencies from a hunk of metal? Also, what about a CB antenna? Would that work? Any suggestions, tips, or websites will help! Thanks!
~Nick

Does anyone make a scanner that will identify the emergency traffic tone that Law enforcement agencies transmit while they have an emergency. I think it is a 1000 Hzs tone they send out every 15 seconds or so. If they don't it would be a good feature so we don't have to figure what agency was in a pursuit or a hold up or whatever.

Just food for thought.....

DDC

Beware of the MIBS!

If you have an internal modem make sure that the two serial ports are com1
and com3 for most cards. com2 then would be the modem. next make sure that
you are not running any programs that could open the com port like a program
for receiving phone calls.

turn the antenna to a vertical position (rotate on long axis 90 degrees) to
catch the vertical radio waves. If you can't find adapters get new wire, use
rg6 it is about $11 for 50 feet at Home Depot, tv antenna up high should
work great, never tried cb antenna

It will be better at picking up some frequencies cause its probably designed
to resonate at certain frequency ranges.
A cb antenna will be good for police and some other stuff that is around
460megs
(well .. CB and cops are reasonably close together in aus)
Hope that helps.
You might want to look at some antenna design theory .. I have a PDF
document somewhere that might help with it.

Voice command would take a pretty hefty processor and memory/storage for the voice recognition and all of ths running inside would cause some serious internal interference, even if well shielded. The scanner would be nearly deaf (no pun intended). Plus, it would cost so much, I doubt anyone could afford it. Although, IBM claims to be developing a wearable computer about the size of a pair of eyeglasses, with a remote processor and drive pack that clips onto your belt....

Think about using a scanner with PC control and some decent software - I use IBM ViaVoice dictation and recognition software and it can be trained to operate most PC applications. I use it with my Icom IC-R8500 software and my AOR8200 software and it works pretty well. Combine that with the voice-synthesis chip in the Icom, which reads out the active frequency (a little slowly though) and you could do most of the basic scanning and searching without seeing a thing.

The Icom is not cheap (about $1500 US) but if anyone did make a scanner with voice recog and control, I think it would cost a lot more than that....

Mine works in win98, but not in WinNT.

The direct frequency window does not work at all.

I can't find any upgrades for the software. It does everything else it is supposed to do.

I think you are talking about glass mount windows. I have tried them.
They are LOUSY! You can get a magnet monut antenna that works good for
around thirty bucks from Radio Shack.

I did this, too. The first thing I ever bought was the radio shack amplified mono speaker. It worked well until it got stolen from my car. Then, I got the bright idea of using the cassette adapter. Wish I had done it all along. Just make sure you get a mono to stereo adapter plug if you need one.

In areas that the Clown Union controls, I think they use a trunk system to control dispatching. (And you wouldn't believe how many clowns they can pack into that truck system!)

I've had absolutely no luck tracking down mime frequencies -- just a bunch of unmodulated carriers. Maybe they've gone digital?

Im going to buy an outside antenna for my scanner at radioshack. im gonna buy the $20 one on pg. 95, #20-176. It has a pl-259 connector on it. My scanners only have motorola. I will need to run 25 feet of cable to my scanners. I want to hook up two scanners to the same antenna. Can I do that with the "T" adapters on page. What I see is this - antenna with 25 feet of _______ kind of cable run into my room, into the "T" adapter. Then, two _______ kind of cable to each scanner, each cable having an adapter on the end to convert it to motorola. Now my questions:
1. Will this hookup work with little signal loss?
2. What kind of cable do I use to run from the antenna to the scanners?
3. Will the "T" adapter cause problems?? Signal loss?
4. Can I have two scanners going at once and still have the same signal distance as if I were only using one scanner?
5. Are there any cheap ways??
Obviously you can see I really dont know anything about this. Please help!
THanks!

Glass mount antennas are terrible. What you gain in convenience, you give back ten fold in performance. Your friend is correct! What about a regular mag mount and run the antenna cable out the back window of the cab? I'm making just a FEW assumptions here. Like your truck is a pickup, you don't live in the artic where open windows are not an option, etc.

Another option would be a high-performance rubber duck or an extendable whip. Both would give better performance than the 6" rubber whip you rec'd with the rig, but the high-performance rubber whip Grove sells is $30 and 12" long. Extendable whips are less expensive, but longer. Not sure how well that would work for you. Also, made sure the antenna remains upright in the vehicle. Get a right-angle adapter if you need to. Laying the rig down so that the antenna lays horizontally is a sure way to kill performance!

Combining the 2 radios w/ a passive Tee invites spurs from each radio getting into the other- causing annoying birdies on both. MATV 2 wa plitters, although designed for 75 Ohm systems show very good port-port isolation at VHF and UHF- well over 30 dB for well designed ones- this will eliminate the spurs problem. Any time you split the signal 2 ways you suffer a real world 3.5 dB or so loss- this may or may not be significant depending on the strength of the stations you monitor.
This is equivalent to the signal dropping by 1/2 of its incoming strength.

You can not hook up two scanners to one antenna because this
will cause RF and electronic interference.

593. Using TV Antennas With Scanners

Newsgroup: rec.radio.scanner
Date: 2000-04-10 00:00:00 UTC

Using TV Antennas with Scanners
By Richard Kendrick CET, N7NT
n7nt@primenet.com
Copyright 1998 by Richard Kendrick
All Rights Reserved

OVERVIEW

Finding and obtaining suitable antennas for general scanner use has been a hot topic for a long time. There has been a storm of controversy surrounding television antennas and their suitability for scanner use. This article will show that television antennas can be a suitable and cost effective solution as a general-purpose directional antenna for your scanner station.

Television antennas come in a variety of sizes and designs, with equally wide variety of specifications. This diversity causes confusion for the scanner listener trying to sort all this information and find a suitable antenna to use. The number of elements and what frequency range to buy are probably the two most common questions.

Generally, the more elements on an antenna, the better the performance. If the stations you are trying to hear are more than 25 miles away, the larger antenna arrays would be a good choice.

BASIC DESIGN OF TELEVISION ANTENNAS

Most TV antenna designs are based on the Log Periodic Dipole Array, or LPDA. The LPDA is similar to a Yagi in construction and appearance, with the main difference in the elements and how they are connected. The LPDA has a series of progressively smaller "active" elements placed on a boom where the longest element on one end, and is a half wavelength at the lowest frequency. The shortest element is on the opposite end, and is a half wavelength at the highest frequency of interest. The end of the antenna with the shortest elements are pointed towards the target transmitter.

The chief benefit of the LPDA is the wide frequency range over which it can be operated. Typically, the antenna can be used over a range of frequencies having a ratio of 2:1 or higher. The main electrical characteristics of feed-point impedance, front-to-back ratio, and gain remains more or less constant over this range. This is not true, however, of the Yagi antenna.

For the LPDA to be useful as a TV antenna, it actually needs slightly more bandwidth above and below the standard TV channels.

That additional bandwidth, or overlap, can be utilized by the scanner listener to squeeze just a little bit more frequency coverage from the antenna than the designers originally envisioned.

FREQUENCY COVERAGE

The frequency range of the antenna you choose depends on what segments of the frequency spectrum your listening will focus on. Antennas are available that cover the VHF channels only, the UHF channels only, and, of course, the VHF and UHF channels. Many models also include the FM standard broadcast band. For the purpose of this article, it will help to define exactly what is meant by VHF, UHF, and standard FM broadcast bands with respect to frequency.

The frequency assignments for the television broadcast band is not a continuous span. The VHF range is specified as channels 2 through 13. Channels 2 through 6 cover the 54 to 88 MHz range and channels 7 through 13 span 174 to 216 MHz. Sandwiched between channels 6 and 7 is the FM broadcast band covering 88 to 108 MHz. Channels 14 through 83, the UHF range, is 470 to 890 MHz. In recent years, the spectrum covering channels 70 through 83 have been reassigned to the Land Mobile and Cellular Services.

View the TV antenna as a device that covers three separate frequency ranges. Based on the nominal bandwidths of a video signal, the three frequency ranges are 54 to 108 MHz, 174 to 216 MHz, and 470 to 890 MHz. Depending on the antenna, the lowest range covers approximately 50 to 112 MHz, yielding a frequency ratio of 2.24:1. Since the center range has a ratio of 1.24:1; it typically would cover a much wider spectrum. By keeping the 2.24:1 ratio, we could expect a frequency range of approximately 120 to 270 MHz. Design tolerances would fill the gap between 112 and 120 MHz making this range useful, too. The highest range has a frequency ratio of 1.89:1. Keeping with the 2.24:1 ratio would give a useful range of 420 to 940 MHz.

POLARIZATION OF TELEVISION ANTENNAS

The last criteria that must be addressed is the orientation, or polarization of the antenna. TV antennas use horizontal polarization and the type of stations scanner enthusiasts monitor have vertical polarization. Horizontal polarization is where the antenna elements are parallel with the surface of the earth and vertical polarization is where the elements are perpendicular to the Earth's surface. TV antennas are designed for horizontal polarization and might require modification for scanner use.

FEEDING THE TELEVISION ANTENNA

There will be no significant performance loss if you use 75-ohm coax and a TV type 4:1 balun. Just choose a good grade of coax with good ultraviolet resistance. Even though many scanner radios have a 50-ohm antenna input impedance, the nominal SWR (1.5:1) is not a

factor for receive only installations. The SWR will vary widely of the intended frequency ranges and will never be optimum. Yes, there is a small amount of loss, but the loss is negligible. You still have the option of using a 6:1 balun and 50-ohm coax also.

MOUNTING AND MODIFICATION OF TELEVISION ANTENNAS

Whether or not the TV antenna needs modified, is based on the type of mast used to mount the antenna. Reorienting the antenna in a vertical fashion puts the mast right in the center of the antenna elements. The presence of the metal mast parallel to the field of the antenna elements would distort the radiation pattern and degrade the overall performance of the antenna. Using a wooden or fiberglass mast solves this problem. If you use wood, some form of weather proofing will be needed in certain parts of the world.

Mounting an antenna with the mast in the field of the elements will require the antenna to be physically modified. Fortunately, the modification is very simple. Most TV antennas use square tubing as the boom. Locate the two mounting holes for the u-bolt clamp and drill two 9/32 inch diameter holes 90 degrees away from the existing holes. Be sure to keep the same center to center spacing so the clamp will pass through the holes comfortably. Depending on the antenna you chose to modify, you might have to move the location of the mounting holes forward or backwards one or two inches to clear an element or the feed system.

If you choose not to modify your antenna, you will need to mount the antenna about a foot from the mast. This will make the mounting more complicated mechanically. Either method will work because neither one is superior to the other. It will depend on what materials you have to work with and your budget.

CONCLUSION

Using a television antenna in a scanner monitoring station offers a reasonable cost to performance trade-off for the scanner listener. You get coverage of the 50 to 270 MHz and 420 to 940 MHz frequency ranges, high gain, good front-to-back performance, and directivity using standard inexpensive TV rotator systems. Obviously, not all antennas available will perform the same in all locations. But for the price and ease of use, the television antenna will provide many happy scanning hours.

594. April 6 Hearing had CTIA and H.R.3489 Wrongfully Blaming Scanners!

Wake up America! They are trying to sneak in scanner restrictions by combining it with a cellular source tax law and adding a Senate scanner restricting bill on top of that.

Most wireless communications experts (non-CTIA members) know restricting radio scanners is the wrong way to protect your wireless privacy!

Because of these laws, citizens of other countries have the right and freedom to own unrestricted-unblocked radio scanners except non-government citizens of the United States of America.

Imagine if they had restricted citizen's reception to parts of the radio spectrum just after the invention of radio. There was wireless radiotelephone networks and radio receivers for the public before the development of cellular and scanners. They could have stopped the American citizens back then, but it would have been wrong and un-American.

Radio scanners are used to fight crime and for personal protection. Services can instantly be heard regarding emergencies, crimes, accidents, hazards, etc. This is the fastest way a Citizen can get time critical information. Thus, Citizens can better protect themselves and better assist Government. For volunteers and Government workers, the radio scanner hobby is used on-duty and off-duty to keep up with on their own services and as a mutual-aid tool for listening to surrounding services outside of their jurisdiction.
Radio scanners are used by:
Volunteer Firefighters -- who may hear news of an emergency prior to official notification.
Police Officers -- to learn of potential emergencies.
Wrecker Operators -- to learn of disabled vehicles.
Journalists and Photographers -- to receive first notice of emergencies.

Motorists -- who want to avoid accidents and know weather and road conditions.
NASCAR Fans -- to monitor talk between drivers and pit crews.
Consumers -- to learn of emergencies in their area.

Radio scanners can serve a genuinely useful function in matters of local, or even national, emergency. As one manufacturer points out, when the nuclear power plant crisis occurred at Pennsylvaniaï¿½s Three Mile Island, local authorities themselves bought hundreds of scanners and supplied them to people living in the vicinity in order to keep them alerted to any important news or instructions.

Radio scanners helps save lives:
For example an old news story, a St. Louis helicopter pilot listening on a scanner heard police describing a man holding onto a bridge above a river. Police worked with the helicopter pilot to save the manï¿½s life.

The 106th Congress is trying for additional radio scanner restrictions with S.2326 and H.R.3489. It started as H.R.514. These similarly worded bills add bad restrictions by requiring the removal of the SMR and PCS radio band in radio scanners and attacks legitimate decoding. SMR is the Motorola iDEN (e.g. Nextel "Direct Connect") 2-way radios used by Government and in the same radio band as Government public-safety radio systems. Also, note that radio scanners do not effectively receive PCS because it is very short-range microwave. Because of this, PCS requires micro-cells or many more cells compared to original 800 MHz cellular. In fact, Jay Kitchen, President and CEO of the Personal Communications Industry Association (PCIA) said "Quite naturally, therefore, some have called for more laws and more regulations. But certain pioneers in the wireless industry have found a technological alternative, one that offers the desired privacy without need for further federal government intervention. Enter digital personal communications services. Like a personal computer, PCS technology transforms spoken words into a complex binary algorithm of 1's and 0's, representing meaningless static to the "ears" of a scanner. In addition, there are infinite different combinations that PCS companies use for breaking up and reassembling the codes. This factor alone eliminates the casual hacker, but even if a determined eavesdropper attempted to intercept a PCS phone conversation, the sound they would pick up would be much like the squeaks and squeals that you hear when you log on to the internet or send a fax. Although nothing is absolute, it would take extremely sophisticated, expensive computers and devices, much like those used by the CIA and top law enforcement agencies, to possibly decode a PCS signal. Furthermore, in some PCS technologies, the coding scheme is changed from call to call, so even if a sophisticated eavesdropper was able to break one of the codes to intercept a call, he would be back to square one with the next call he targeted." Proof why S.2326 and H.R.3489 has a unnecessary wording and has parts that make it a ludicrous law.

They make these new bills sound good when they say it is for your privacy to stop eavesdropping but in reality gives them the dangerously increasing power to close Government radio communications from the average American and gives you the illusion it better protects you.

Local and State Governments and some departments of Federal Government started using the new digital Business Radio System in some hopes they can operate more in secrecy from the taxpaying Public and the News Media. No radio scanner can hear Motorola iDEN (e.g. Nextel "Direct Connect Group Call or Private Call") 2-way radio (non-cellular phone) communications.

Government closes Public-Safety communications when they use the proprietary Motorola iDEN radios and there are other things to note about misuse of this new technology. The Government uses tape recorders

to keep records of their radio traffic on Government radio systems. Not tape-recorded for the record by Government is their Government use on the proprietary Motorola iDEN (e.g. Nextel "Direct Connect") radio systems. Some people in Government think the new Nextel will give them the power of privacy or secrecy unchecked by the taxpaying Public. In addition, organized criminals may find the use of Motorola iDEN (e.g. Nextel) helps them pull-off planned crimes easier. In addition, Motorola has sold the iDEN technology to other countries that do not have democracies (China, etc). Because of this new technology, we need new open government communication laws. Motorola, SAFCO, or Ericsson test equipment can decode iDEN and Cellular. It is extremely expensive and can be used by your government to discreetly eavesdrop on you, law or no law.

These letters against these bills say it best. H.R.514 has evolved into H.R.3489 and S.2326 in the 106th Congress.

Legislative Hearing
H.R. 3489, the Wireless Telecommunications Sourcing and Privacy Act
Subcommittee on Telecommunications Trade & Consumer Protection
April 6, 2000

Prepared Statement of Mr. Thomas E. Wheeler
President and CEO
Cellular Telecommunications Industry

Wireless Privacy Enhancement Provisions of H.R. 3489

I would also like to express my strong support for two
other important
elements of H.R. 3489. One such element is the
incorporation of the text
of H.R. 514, the Wireless Privacy Enhancement Act,
legislation lead by
Congresswoman Wilson which passed the full House, most
recently by a
vote of 403-3 on February 25th, 1999. (I would note as
an aside, that this
legislation was introduced in the other body last
week.) This component
of the legislation will further encourage the growth
and development of
wireless services by deterring eavesdropping and
affording subscribers
even more privacy protection than they have under
current law.

Since the early days of wireless communications, Congress has tried to protect the privacy rights of wireless communications. The original Communications Act of 1934 made it illegal to intercept and divulge the contents of any radio communications without authorization. Over the years, Congress strengthened the laws governing wireless privacy when it became apparent that existing protection was insufficient. For example, in 1986 the Electronic Communications Privacy Act (herein, "ECPA") made it a crime to intentionally intercept wireless conversations or to disclose the contents of those conversations. ECPA also made it a crime to manufacture, sell, or possess a device that the person knows is primarily useful for intercepting wireless communications. In 1992, Congress amended the Communications Act to prohibit the manufacture and importation of cellular frequency radio scanners.

Unfortunately, despite Congress's efforts to protect wireless privacy, electronic eavesdroppers have found loopholes in the law. For example, one case was lost after prosecutors were unable to prove that the eavesdroppers had "intended" to intercept wireless conversations and another because the eavesdropper had not "disclosed" the contents of a conversation. Other cases were lost because the ability of the scanners to also scan non-cellular frequencies or perform other permissible functions made it difficult to prove that the device was "primarily useful" for scanning cellular frequencies. Moreover, because current law only covers scanners used to eavesdrop on "cellular frequencies," it does not clearly prohibit equipment that can intercept signals from newer PCS phones.

Emboldened by these loopholes in current law, hackers have developed a "gray market" for modified and modifiable wireless

scanners. Some of
these outlaws even advertise in magazines and on
Internet web sites that
their scanners have cellular frequency blocking
components that can be
easily overcome with minor alterations. The information
and equipment
necessary to make these modifications are also widely
advertised,
sometimes with blatant offers to unblock the cellular
frequencies after the
equipment is purchased.

The Wireless Privacy Enhancement provisions attacks
these problems
from several fronts. First, they expand the definition
of the frequencies that
may not be scanned to include digital PCS frequencies
as well as
cellular. I am pleased to say that this provision
reflects a compromise
between CTIA and the amateur radio community and it
ensures that
citizens are not prevented from listening to
non-commercial radio
frequencies like those in the emergency or public
safety bands.

Second, they clarify that it is just as illegal to
modify scanners for the
purpose of eavesdropping as it is to manufacture or
import them. It also
directs the FCC to modify its rules to reflect this
change. This provision
will help reduce the growing "gray market" in modified
and readily
modifiable cellular and PCS scanners and digital
decoders.

Third, they clarify that the Communications Act
prohibits the interception
or the divulgence of wireless communications, either
one standing alone
is prohibited.

Fourth, they increase the penalties under the
Communications Act to
make them consistent with the penalties for violating
the Electronic
Communications Privacy Act. Under the new penalty
provisions, violators

will be subject to a fine of $2,000, six months in
jail, or both for a willful
violation, and these penalties increase for repeat
violations.

Finally, they require the FCC to investigate and take
action regarding
wireless privacy violations under the Communications
Act, regardless of
any other investigative or enforcement action by any
other federal agency.
This provision will help ensure that these newly
strengthened privacy
protections are fully enforced in the future.

The millions of Americans who use wireless
communications deserve to
have their privacy protected. CTIA supports your
efforts to improve the
security of wireless telephone calls, and again I
commend Mrs. Wilson
and this Subcommittee for your work on the Wireless
Privacy
Enhancement issue.
End Quote

Read it carefully, it goes slightly beyond PCS and Cellular.

They are distorting the issue of eavesdropping and radio scanners to scare the foolish!

It is wrong to restrict airwaves in a way that blames and punishes you and me instead of blaming and punishing the greedy cellular companies who, in the past, did not want to spend their money in secure cellular systems. Today, they have finally secured the cellular systems making radio-band blocking of scanners totally wrong. Reword the "Wireless Eavesdropping Protection Act of 2000" and reword the "Wireless Telecommunications Sourcing and Privacy Act" and amend the "Wireless Privacy Enhancement Act of 1998" to remove radio scanner restrictions because it is technically and logically foolish. Many other electronic devices can not be reasonably be controlled by American Constitutional Law and they receive cellular radio bands. Radio-band blocking and purposely closing Government radio traffic is not the American way.

Again they are, law after law, increasing the reception restrictions beyond cell phone communications into slowly closing government monitoring. In the past, part of Nazi law restricted radio reception with fear tactics to assure the growth of an evil empire. Their country developed into a prosperous society with the latest technology for their time, so their citizens did not care and government wanted to hide their wrong doings. The rest is history but it will try to repeat itself.

Hi,

I live on the east coast of Canada and we
get lots of snow, ice and wind.

I need an excellent high-gain good scanner antenna for my 40 foot
tower. I live in the sticks and that is why I need high-gain. It has to
be able to take what old man winter can throw at it.

Need recomendations please and Thank You!

Mark

>Icom,and I don't think anyone will ever understand what they are thinking
>about some "features".

The weird thing is that I have an Icom aviation transceiver (IC-A20,
big heavy handheld) and it is much better. It has TWO "function"
buttons, one on the side near the PTT and one on the front. Both
of them "latch" for a while when you press them, so the multi-button
functions just require pressing FUNC first and the other button
afterwards. The sheer size of the radio requires two hands to operate
it, but there's no need to hold down FUNC while pressing anything else.

I am setting up a web site dedicated to Clown Frequencies, so people can listen to clowns like they listen to race cars. If you know of any frequencies please post them.

And yes, i did do a search on the internet for clown frequencies and found nothing.
And no, the FCC has no part of the spectrum dedicated to clown frequencies.

The closest i have come is the Ronald Mcdonald house.

I really want this to be a success.
Thank you.

Hmmm...ok. I have a internal modem. I have no conflicts. Can someone tell me
what is the name of the driver for the scanner?

I see a serial.vxd
VMM32.VXD
serialui.DLL
Is this for the scanner?

I bought a Pro-94 last week when they went on sale for $199. I think
the regular price was $299. I really like it, it took me a while to
figure out how to input the frequencies. With a little help from
the folks in this newsgroup I learned about trunking and scanners.
I bought the "Big Book of Frequencies" from RS as well. It turned
out to be very useful and up-to-date for central Texas. I was able
to enter all of the county sheriff, Leander, Cedar Park, and Austin
police departments. One thing to remember is that you need to enter
all of the frequencies for a given police department. One of the
really useful features of the Pro-94 is that the weather and
weather emergency are always there with a push of a button. It
has the capability of picking up the weather emergency signal.
You place it in a standby mode and it will come on when severe
weather alerts are sent out.

Just wondering if anyone has seen any information about the soon to be released IC-R3 from ICOM? I saw an Ad for one on the back of the April issue of Monitoring Times. It claims to be a new Wide Band receiver which covers a frequency range of 500 khz to 2450 Mhz and includes a 2-inch TFT color display which will allow you to view TV programs and various wireless camera broadcasts. It should be interesting to see if this unit will handle both NTST and PAL video signals.

BTW, the IC-R3 has NOT been approved by the FCC for sale in the USA.

probably, but it's illegal to make modifications to do so.
I believe it's illegal to monitor cellular and remote telephone
frequencies anyway, that's why the pro-94 can't do it.

Source record: 90466

I'm a novice at this, but my question is about squelch or sensitivity. I have my scanner hooked to an outside antenna. I listen to the local fire, ems and police freqs. I was wonder if there is a way to set the squelch for seperate channels. My problem being I pick up unwanted traffic on the fire freq from out of state (about 40 miles away). They are on the same freq as my local county fire. If I don't use my outside antenna I don't have the problem with the out of state traffic, but also lose my ability to listen to car to car or car to base on the police freq for my county. Is there scanners that you can set the sensitivity for each channel. If so what models are they. I'm also interested in models of scanners that can be controlled by your computer. Any web sites on software or models would be helpful!

Thanks,

Hi Todd,

You need to obtain a scanner which has CTCSS or DPL capabilities. This would allow you to program in the current CTCSS or DPL tones for your local Fire and Police Dept. Have a look at the Strong Signals site for a list of scanners that have CTCSS and DPL capabilities.

http://www.strongsignals.net/

Hope this helps

Bob

Message-ID: <38F20577.C964D60D@innosoft.com>
Source record: 90468

Does anyone have any opinions on antennaes that you stick on the
outside of your window then stick the connector on the inside.
Do these work very well? I really don't want to drill a hole
in my new truck to run an antennae wire for a handheld scanner.
One of the guys here at work said that the reception wouldn't
be much better then the little rubber antennae that the scanner
came with. BTW the scanner I have is the RS Pro-94.

Thanks,
Tom

It will be interesting to see how many countries it can cover at once.

When decoding baseband video signals on a wire, there are only a few standard forms: NTSC, PAL, and SECAM (though there are a few weird hybrids like NTSC 4.43). But when you want to receive video "off the air", you also need to allow for different channel allocations in different countries, different subcarrier frequencies, different frame rates, etc.

I once saw a map that showed video standards around the world, and there were about 20 distinct versions of TV broadcast systems when these differences are taken into account.

Next weekend, April 15 & 16 is the Chattanooga airshow. Although the website leaves a lot to be desired, information can be obtained by going to:
www.erlanger.org/airshow/asmain.htm or calling:
423-778-2000.

The good stuff that's flying includes: F-14 & F-15 demo's, the F-104 Starfighters, B-2 (Saturday), F-117 (Sunday), Shockwave Truck & the Thunderbirds. Everything else flying will just be smoke blowers.

I'm going, however it will be on Sunday only. If anyone would be interested in meeting up, please
e-mail me and we'll go from there. I'll also be transmit capable on FRS & CB and will be monitoring FRS channel 1 (462.5625) & CB channel 40 (27.405).

Message-ID: <8ct47j$db3$1@nnrp1.deja.com>
Source record: 90473
Cross-posted to: alt.radio.scanner,rec.radio.scanner

A couple things to consider:

1) Using a 75-ohm cable and adapter at the antenna end if necessary
should work ok with your scanner.

2) If you are listening to most VHF and UHF frequencies, you will need
to align the antenna into VERTICAL polarity...In other words, instead
of the antenna elements being parallel to the ground, it needs to be
turned 90 degrees to be perpendicular to the ground.

It`s "Kinda Pricey" because it DELIVERS THE GOODS.....
You will not find another program that scans as fast, or has as many features, period. From false signal detection, to information display, tone decoding, tone squelch, just sheer channel capacity (999 banks of 1000 channels), searching capability, the ability to auto-program tones, I could go on for another couple of paragraphs. GOOD scanning software has never been cheap, and probably never will be.....

I was hoping that a single unit would support all three. Oh Well.

I notice the Ad claims that it supports a Digital Wireless camera to
monitor baby room monitors, wireless traffic cameras, etc.

I also notice that the Javiation site makes mention of a CF3 TV mode.

What does CF3 stand for?

I agree with Vic. I was hoping that Uniden would eventually remedy this
but even their latest CLT line of AM/FM/alarm scanners don't do it. The
only ones I've had personal experienece with that does allow use of the
scanner with weather alert on are the BCT-12 and PRO-92.

I'm beginning to seriously doubt that I'm going to receive mine.

Ordered last Saturday via the Web site. On Monday, J&R called to verify my shipping address. Checking my credit card balance, I noticed the amount hadn't yet been deducted, but a "hold" against the amount had been placed on my credit limit. Package never arrived. Friday, I checked and noticed the hold on my credit card had been lifted.

Gee, it would have been nice of them to let me know I wan't going to be getting the scanners...especially after they called to confirm my shipping address!

The distant traffic will have lower signal levels than
local traffic.
With some luck maybe you can separate them.
There are two kinds of squelch:
one is selecting signal strength,
the other can distinguish between noise, digital signals,
and what is probably speech, all parameters
adjustable separately.

Hi All,

I've been looking at purchasing the BC890XLT scanner. I mainly use my scanner for local police/fire/ambulance, aircraft and weather. Nothing that I track is trunked.

I know what all of the features on this scanner are but two. What are the VFO Control and CTCSS Tone Board features of this scanner?

Thanks,

A VFO control (Variable Frequency Oscillator) controls which frequency the scanner is on. I dont know if it is a rotary control or not, but that is it's main function. A CTCSS Tone Board decodes tone that some radio systems use. A example of a radio that uses CTCSS is a common FRS radio. The only thing is, that FRS radios call the CTCSS tones "Privacy Tones". It is a pretty neat feature once you learn to use them. Email me if you need any more help or have any more questions.

The Vfo is the knob for changing the freq or channel (depending on what button is pushed) and ctcss is a tone board that picks of tones that may or may not be used in your area. I recommend though if you do not need the truncked feature you might want to find a scanner that cost less without this feature. This is what you are paying for in this scanner.

I was recently given an old Pro-2020 scanner that doesn't seem to work. The radio just doesn't seem to receive any signals, no matter how strong they are. The memories seem to work great and it will actually 'scan', but the signals just aren't there, even if the squelch is off.

Any suggestions????

Pete

Since my company already broadcasts NASCAR team communications on the net, let me know when the clown freqs are up and we'll talk to Budweiser about getting you a sponsorship. They love anything and everything related to NASCAR and clowns.
If we could get the clowns to ride around the track during a Winston Cup race while telling Jeff Gordon jokes on FRS radios and drinking Bud Light, we'd be rich... We can sell sponsorship space on the unicycles - "Krusty will be riding the Wrenchead.com cycle today..", complete with cycle-cams. Budweiser would set up prize money for the driver who killed or maimed the most clowns at the halfway point. You're a genius.

You really should try Radio Manager for 40.00
It runs RINGS around Winscan...Winscan does zilch compared to RM

Do yourself a big favor..It is the best!

655. Radio Shack Pro-79 - Any Good???

I saw the Radio Shack Pro-79 Handheld 200 ch scanner at Radio Shack (duh) today. It's on sale for $100. I've always wanted a Handheld scanner, and this is one I can afford. Does anybody have this scanner? Is it any good? How is Radio Shack's history with handhelds? Anybody know the frequency range on the pro-79? Thanks!

Hello,

> If he wants to know where to buy one in the nederlands then why in the hell
> has he posted to an Australian newsgroup - aus.radio.scanner???

I don't want to know where to buy the BC245XLT in the Netherlands. I'm just looking for people, living in the Netherlands, who own a BC245XLT or who have experience with the BC245XLT.

Mayby those people are reading an Australian newsgroup. You'll never know.

I would think our second ammendment rights are far more
important than "scanners".. Of course I could always throw
my scanner at a home invader. <BG> I guess thats what
they do in Canada, Austrailia, England and other Countries.

as always, My Opinion.

It doesn't matter what the default settings of the serial port are;
when the scanner software opens the port, it immediately changes the
settings to what it needs.

>Anyways.....Windows does see it ....it is just that I'm trying to varify what

hi from Central Europe,

I'll take my scanner on a criuse in the Carribean Sea next week.
Being interested mainly in aero comms I'd appreciate if someone
could give me an idea where to find TWR/APP freqs for these
locations:

Guadeloupe:
St. Kitts:
Antigua: APP 119.1 GND 121.9 TWR 118.2 (???)
Tortola:
St. Maarten:
St. Barts:
Martinique:

as well as general ATC freqs I could try in that part of the world.

many thanks and regards,

Pretty clear to me. But then, if you didn't know...

There are two kinds of squelch circuits used in radios. Noise squelch circuits, and signal level squelch. (Not counting 'selective' squelch circuits like subtones and 'triggered' squelch like DCS or tone burst.)

If you have a 'level sensitive' squelch, then you just turn it up to eliminate far away signals. But then, this can be a problem with local signals that are very variable, like the police and fire on portable units. Unless you are listening to a repeater.

But this kind of squelch is not very common. Most scanners use what's called a 'noise squelch'. This is based on the fact that an 'FM' signal 'quiets down' when it's received. Scanners generally receive an FM signal (or lack of one) all the way to audio. Without a real signal, there is a LOT of high frequency noise. They amplify this, and look for the high pitched scream. If it's there, no signal. If it's not there, then there must be audio. When you set the squelch control, your setting a level for how sensitive the high frequency noise detector is.

This is also why you hear some people refer to 'popping out of the passband'. If a signal is TOO strong, and deviates more than 'normal', the energy out of the normal passband can be picked up by the noise amp, causing the squelch circuit to cut them off.

What the original poster I think was refering to was that he wanted to be able to set different squelch settings for each channel. While some HAM rigs can do this for 'type' of squelch, I know of no consumer grade scanners that can set the level for the squelch on a per-channel basis.

Some of the computer controlled scanners may technically have that capability, but I really don't know of any. Usually the squelch is set on a 'global' basis. Although if you had a scanner 'card' then I suppose it would actually center on how fast the software can adjust and/or control the hardware and get a valid reaction.

I do have a pickup but not the sliding rear window. I live in the
Austin Texas area where it's almost always warm and hardly ever
rains.

> Another option would be a high-performance rubber duck or an extendable
> whip. Both would give better performance than the 6" rubber whip you rec'd

> down so that the antenna lays horizontally is a sure way to kill
> performance!

I got several emails from people claiming that glass mounts are really good,
some thought they sucked. One guy put it pretty well, he said; They are really
no better than if you held the scanner out the window and listened with
a head phone. I stopped off at Radio Shack last night and picked one up.
Installation was very easy and the performance is much better than before.
You where right about laying the scanner horizontal, I was just letting it
lay in the seat next to me. Now with the glass mount I can lay it next to
me and still have the antennae vertical. I really don't need the high gain
I'm able to pick up the local police to find out about traffic accidents
to avoid.

Thanks to everyone for your help,
Tom

James Madison never imagined these "assault radios" when he wrote the
Bill of Rights.

Funny how the same people taking away the guns are the ones trying to
take away public monitoring of government radio traffic . . .

671. Re: Using TV Antennas With Scanners

Newsgroup: rec.radio.scanner
Date: 2000-04-11 00:00:00 UTC
From: toomanyradios@aol.com
Message-ID: <20000411113518.00590.00002058@nso-fi.aol.com>
Source record: 90359

If you live in a subdivision or other area where homeowners regulations or restrictive covenants prohibit an outdoor scanner antenna, the TV antenna approach may prove quite advantageous to you.

Recently enacted federal legislation removes and supercedes all prohibitions against outdoor television antennas mounted 12 feet or less above the roof line.

In other words, if you're using a bonafide TV antenna for scanner reception, the local Homeowner Nazis can't do squat about it.

Download the program named wintone 2 and then hook up your scanner to your computer and capture the PL tone. Enter it in and "viola" you have it.

God Bless and Good luck.

I have had one for 3 years. It died about a year after I got it using it 24 hours a day. Sat on a shelf for 2 years and finally sent it to Uniden for repair. Works good now and I have done the discriminator tap on it as well as the tone board option. Hard to find a board so if you can get the one from the other post then get it. The discriminator out is interesting but I don't get enough signal strength to decode anything but paging.

Enjoy.

You got it right! Probe is very powerful. For the money, you will be very happy running this dos program. It may not be pretty to look at or have all the Windows glitz, but it gets the job done better than any Windows based program I have used.

My 2 cents.

Fellow Scanning Enthusiasts,

I'm looking to sell my Bearcat/Uniden 9000XLT Scanner. Does anyone have any idea

of what it might be worth?

Features are as follows:

10 Priority Channels
Coverage: 25MHZ to 1300MHZ
500 Channels
Automatic Sorting
Automatic Store
Auxilliary Tape Outputs
Channel Lockout
Data Skip Function
Dot Matrix LCD Display
Frequency Transfer
Includes 800 MHz & Aircraft
One Touch Weather
Optional CTCSS Tone Board
Programmable Scan Delay
Selectable Attenuator
Selectable Mode (AM, WFM, NFM)
Triple Conversion
Twin Turbo: Scan & Search
VFO Control Knob
includes Aircraft Band
Cellphone reception in 300MHZ area.

Thanks,

John

I have for sale probably one of the best handheld scanners ever made, the AOR AR8000. This one is in MINT condition cosmetically & electronically. Serial number of the radio is 014562. I had the original box but cannot find it now. If I can find it that will be included also. I'm the original owner. This radio has been used VERY little and has been well taken care of. Comes from a NON-smoking enviornment. Includes the AOR AR8000, The Original Owners Manual, Rubber Antenna, Belt Clip, Carrying Strap, 8 Rechargeable AA batteries & Power Supply. I will also be including a book from Grove Enterprises "Sports and Entertainment Frequencies by Bob Grove". I'm asking $400.00 plus shipping & insurance. If you have any questions I would be very happy to answer them.

The AR8000 is a highly sensitive hand-held receiver boasting a very wide frequency coverage of 500KHz to 1900MHz without gaps. Step size is programmable in multiples of 50Hz for smooth tuning. The all mode reception provides AM,USB,LSB,CW,NFM and WFM. A custom manufactured ferrite bar aerial is neatly installed at the top of the receivers cabinet to enhance receive performance when listening to Medium Wave or Shortwave services. The highly visible LCD is a dot matrix format which enables many new facilities to be used, many of which have never been seen before especially on a hand held design. Two VFO frequencies may be displayed on the LCD simultaneously, one providing a stand-by frequency available for quick transfer. When frequencies are entered, ALPHANUMERIC comments may be stored along with frequency, mode & attenuator status simplifying the job or recalling and identifying memory channels. The LCD provides four lines of display so that additional information may be provided and displayed at the same time, these include a signal strength bar meter and a band-scope showing band occupancy. The AR8000 Has The Following Features Plus MANY More. "Backlit Keyboard and LCD Display for Easy Nighttime Operation", "2 Independent VFO's displayed simultaneously", "1000 Memory Channels with Alphanumeric tagging", "Band Scope - In VFO mod it will show activity five channel steps on either side of the center frequency", "Select

Scan - Allows you to tag certain memory channels (up to 100 in any bank) to scan", "Delay Search/Scan - Receiver resumes scanning after a time limit (Programmable 0.1 - 9.9 seconds , Hold or Off)", "Audio Search/Scan - Allows you to set the radio to resume scanning when there is no modulation on a frequency", "Free Search - Stops scan on active channel for a programmed time period (1 to 99 seconds)", "S-Level Search/Scan - Stops on a busy channel only when the S-meter is above a preset level (1 to 7 bars)", "Auto Store - Automatically writes active search frequencies into memory bank "J" (can be disabled)", "20 Programmable Search Banks", "Password Lockout - prevents unauthorized users form accessing 10 of your memory banks", "EEPROM Memory, requires no battery or capacitor", "Edit Mode - Allows quick editing of stored data", "Priority - Programmable Priority Feature", "New user and Expert Modes - Two levels of operation allow you to learn at your own pace", "Clone - Allows you to copy one AR8000 to another", "Full Computer Control - Allows you to control the radio via a PC (software & cable required)", "Auto Mode Select - Uses a bandplan to select the proper mode and step", "AM, FM, WFM, USB, LSB and CW receive modes", And many more features!

Radio Shack sells an antenna mount for your car side window. It slides over the top edge of the window and you can roll the window up. It has BNC connectors on both ends...Male on one and female on the other. You can then attack your "rubber duck" antenna outside the car. I would recommend buying Radio Shack's telescoping scanner antenna. It will perform much better.

Of course a better antenna would be a mag-mount scanner antenna for the trunk or top of the car.

One time I was tracking a gnarly leak and traced it to a drop going into a subscribers house. When I dosco'ed the drop at the tap, the people from the house next door (that is physically connected to the house in question) came out complaining that their cable went out. A little research showed that the guy next door did not subscribe to cable.

Needless to say there was a probably a nice poker game at one of those houses that evening to help pass the time without TV.

696. LIKE NEW !!=> [Opto Xplorer "Unblocked"]<===Mint

Newsgroup: rec.radio.scanner
Date: 2000-04-11 00:00:00 UTC
From: msisco9939@aol.com
Message-ID: <20000411180542.06018.00002338@ng-ch1.aol.com>
Source record: 90384

Yep:

I have a Consignement OptoElectronics Xplorer Near Field Sweep Receiver that covers the entire RF spectrum up to 2 Ghz, and YES it is also Factory Unblocked and covers the Cellular Frequencies, and would be a Perfect addition for the Professional Two-Way or Cellular Service Technician.

This will Sweep the Entire RF Spectrum to 2 Ghz in less than 1.5 Seconds, and will display the RF Frequency, Signal Level, PL Tones including Digital Coded Squech, and even will record and display DTMF Tones. This is the Super Receiver for Swap Meets to check those " working" radios before a purchase.

Picture can be seen @

http://www2.4dcomm.com/metrotech/xplorer.jpg

This has been a (1) owner type unit, and comes with a number of Factory Accessories.

The Optoelectronics Xplorer is in Mint Condition, and comes with the Factory Charger / Power Supply, Factory Carrying Case, Telescoping Antenna, and as a BONUS, has the Factory Downloading Cable and Software for your PC, and some other acc'y which are optional if you want the whole package.

$650.00+$10.00 for shipping and handling for the above, and

$675.00 if you desire the Small Antennuators which cover the 50 mhz to 1 Ghz Band (very usefull in a High level RF enviroment)

Terms:

Acceptable PrePayment in the form of a Postal Money Order (If immediate shipping is desired) or a Personal / Business check is A-OK too if you do not mind a Short Shipping Delay due to bank processing time. This is required only the first time or two as once you are in the data base, PrePayment is no longer required

From: Jeff <heffedSPAMOFF@utah-inter.net>
Message-ID: <38F3EA79.5E0C36D7@utah-inter.net>
Source record: 90390
Cross-posted to: rec.radio.scanner,alt.radio.scanner

What is the best antenna for a handheld scanner? (with BNC connector)

Rubber ducks appeal to me because of their flexibility, but I think I could make do without the flexible antenna if there is something better around.

Anybody have any info on the "double duck" antennas that scannerworld sells?

http://www.scannerworld.com/sw/vx/15wb.htm

I don't know too much about antennas, but it seems to me there must be more to it than just sticking two antennas together. Otherwise everyone would do it. Is this a sound principle?

Thanks in advance for any assistance.

Jeff

Drake R-8 and MS-8 for sale.....

I have a excellent condition Drake R-8 and MS-8 speaker for sale. Both work perfectly and look great. I am the second owner and a non-smoker. Original box and manual are included.

$525 shipped UPS ground anywhere in con.US.

E-mail if interested or for information.

The Yupiteru 7100 would be the best medium priced handheld available,
used mine for 5 years. The signal pulling power is mind boggling.

The 9000M3 from http://www.bander.com is even better in reception
and I have had 15 months of use with this one.

G'day from Western Australia!

After getting no replies on aus.radio.scanner, I thought I'd try here.

After about 8 years of service, my father's IC-R100 has failed.
Specifically, AM and FM have gone totally deaf, but WFM is still working OK.
I remember reading, a few years ago, that this is a "known problem" with
R100's, but I never thought to print the details, and now regret it! Can
someone please point me in the right direction?

Wake up America! They are trying to sneak in scanner restrictions by combining it with a cellular source tax law and adding a Senate scanner-restricting bill on top of that.

Most wireless communications experts (non-CTIA members) know restricting radio scanners is the wrong way to protect your wireless privacy!

Because of these laws, citizens of other countries have the right and freedom to own unrestricted-unblocked radio scanners except non-government citizens of the United States of America.

Imagine if they had restricted citizen's reception to parts of the radio spectrum just after the invention of radio. There was wireless radiotelephone networks and radio receivers for the public before the development of cellular and scanners. They could have stopped the American citizens back then, but it would have been wrong and un-American.

Radio scanners are used to fight crime and for personal protection. Services can instantly be heard regarding emergencies, crimes, accidents, hazards, etc. This is the fastest way a Citizen can get time critical information. Thus, Citizens can better protect themselves and better assist Government. For volunteers and Government workers, the radio scanner hobby is used on-duty and off-duty to keep up with on their own services and as a mutual-aid tool for listening to surrounding services outside of their jurisdiction.
Radio scanners are used by:
Volunteer Firefighters -- who may hear news of an emergency prior to official notification.
Police Officers -- to learn of potential emergencies.
Wrecker Operators -- to learn of disabled vehicles.
Journalists and Photographers -- to receive first notice of emergencies.

Motorists -- who want to avoid accidents and know weather and road conditions.
NASCAR Fans -- to monitor talk between drivers and pit crews.
Consumers -- to learn of emergencies in their area.

Radio scanners can serve a genuinely useful function in matters of local, or even national, emergency. As one manufacturer points out, when the nuclear power plant crisis occurred at Pennsylvaniaï¿½s Three Mile Island, local authorities themselves bought hundreds of scanners and supplied them to people living in the vicinity in order to keep them alerted to any important news or instructions.

Radio scanners helps save lives:
For example an old but true news story, a St. Louis helicopter pilot listening on a scanner heard police describing a man holding onto a bridge above a river. Police worked with the helicopter pilot to save the manï¿½s life.

The 106th Congress is trying for additional radio scanner restrictions with S.2326 and H.R.3489. It started as H.R.514. These similarly worded bills add bad restrictions by requiring the removal of the SMR and PCS radio band in radio scanners and attacks legitimate decoding. SMR is the Motorola iDEN (e.g. Nextel "Direct Connect") 2-way radios used by Government and in the same radio band as Government public-safety radio systems. Also, note that radio scanners do not effectively receive PCS because it is very short-range microwave. Because of this, PCS requires micro-cells or many more cells compared to original 800 MHz cellular. In fact, Jay Kitchen, President and CEO of the Personal Communications Industry Association (PCIA) said "Quite naturally, therefore, some have called for more laws and more regulations. But certain pioneers in the wireless industry have found a technological alternative, one that offers the desired privacy without need for further federal government intervention. Enter digital personal communications services. Like a personal computer, PCS technology transforms spoken words into a complex binary algorithm of 1's and 0's, representing meaningless static to the "ears" of a scanner. In addition, there are infinite different combinations that PCS companies use for breaking up and reassembling the codes. This factor alone eliminates the casual hacker, but even if a determined eavesdropper attempted to intercept a PCS phone conversation, the sound they would pick up would be much like the squeaks and squeals that you hear when you log on to the internet or send a fax. Although nothing is absolute, it would take extremely sophisticated, expensive computers and devices, much like those used by the CIA and top law enforcement agencies, to possibly decode a PCS signal. Furthermore, in some PCS technologies, the coding scheme is changed from call to call, so even if a sophisticated eavesdropper was able to break one of the codes to intercept a call, he would be back to square one with the next call he targeted." Proof why S.2326 and H.R.3489 has unnecessary wording and has parts that make it a ludicrous law.

The real motivation for these laws is political money from CTIA and attempts to stop the average citizen from knowing what a Congressperson maybe doing wrong and illegal. Nowadays radio scanners do not receive digital Cellular but recall the past Newt Gingrich stories involved the now obsolete analog Cellular and political corruption.

Local and State Governments and some departments of Federal Government started using the new digital Business Radio System in some hopes they can operate more in secrecy from the taxpaying Public and the News Media. No radio scanner can hear Motorola iDEN (e.g. Nextel "Direct Connect Group Call or Private Call") 2-way radio (non-cellular phone) communications.

Government closes Public-Safety communications when they use the proprietary Motorola iDEN radios and there are other things to note about misuse of this new technology. The Government uses tape recorders to keep records of their radio traffic on Government radio systems. Not tape-recorded for the record by Government is their Government use on the proprietary Motorola iDEN (e.g. Nextel "Direct Connect") radio systems. Some people in Government think the new Nextel will give them the power of privacy or secrecy unchecked by the taxpaying Public. In addition, organized criminals may find the use of Motorola iDEN (e.g. Nextel) helps them pull-off planned crimes easier. In addition, Motorola has sold the iDEN technology to other countries that do not have democracies (China, etc). Because of this new technology, we need new open-government communication laws. Motorola, SAFCO, or Ericsson test equipment can decode iDEN and Cellular. It is extremely expensive and can be used by your government to discreetly eavesdrop on you, law or no law.

These letters against these bills say it best. H.R.514 is now H.R.3489 and also S.2326 in the 106th Congress.

Legislative Hearing
H.R. 3489, the Wireless Telecommunications Sourcing and Privacy Act
Subcommittee on Telecommunications Trade & Consumer Protection
April 6, 2000

Prepared Statement of Mr. Thomas E. Wheeler
President and CEO
Cellular Telecommunications Industry

Wireless Privacy Enhancement Provisions of H.R. 3489

I would also like to express my strong support for two other important elements of H.R. 3489. One such element is the incorporation of the text of H.R. 514, the Wireless Privacy Enhancement Act, legislation lead by Congresswoman Wilson which passed the full House, most recently by a vote of 403-3 on February 25th, 1999. (I would note as an aside, that this legislation was introduced in the other body last week.) This component of the legislation will further encourage the growth and development of wireless services by deterring eavesdropping and affording subscribers even more privacy protection than they have under current law.

Since the early days of wireless communications, Congress has tried to protect the privacy rights of wireless communications. The original Communications Act of 1934 made it illegal to intercept and divulge the contents of any radio communications without authorization. Over the years, Congress strengthened the laws governing wireless privacy when it became apparent that existing protection was insufficient. For example,

in 1986 the Electronic Communications Privacy Act (herein, "ECPA") made it a crime to intentionally intercept wireless conversations or to disclose the contents of those conversations. ECPA also made it a crime to manufacture, sell, or possess a device that the person knows is primarily useful for intercepting wireless communications. In 1992, Congress amended the Communications Act to prohibit the manufacture and importation of cellular frequency radio scanners.

Unfortunately, despite Congress's efforts to protect wireless privacy, electronic eavesdroppers have found loopholes in the law. For example, one case was lost after prosecutors were unable to prove that the eavesdroppers had "intended" to intercept wireless conversations and another because the eavesdropper had not "disclosed" the contents of a conversation. Other cases were lost because the ability of the scanners to also scan non-cellular frequencies or perform other permissible functions made it difficult to prove that the device was "primarily useful" for scanning cellular frequencies. Moreover, because current law only covers scanners used to eavesdrop on "cellular frequencies," it does not clearly prohibit equipment that can intercept signals from newer PCS phones.

Emboldened by these loopholes in current law, hackers have developed a "gray market" for modified and modifiable wireless scanners. Some of these outlaws even advertise in magazines and on Internet web sites that their scanners have cellular frequency blocking components that can be easily overcome with minor alterations. The information and equipment necessary to make these modifications are also widely advertised, sometimes with blatant offers to unblock the cellular frequencies after the equipment is purchased.

The Wireless Privacy Enhancement provisions attacks these problems from several fronts. First, they expand the definition of the frequencies that may not be scanned to include digital PCS frequencies as well as cellular. I am pleased to say that this provision reflects a compromise between CTIA and the amateur radio community and it ensures that citizens are not prevented from listening to non-commercial radio frequencies like those in the emergency or public safety bands.

Second, they clarify that it is just as illegal to modify scanners for the purpose of eavesdropping as it is to manufacture or import them. It also directs the FCC to modify its rules to reflect this change. This provision will help reduce the growing "gray market" in modified and readily modifiable cellular and PCS scanners and digital decoders.

Third, they clarify that the Communications Act prohibits the interception or the divulgence of wireless communications, either one standing alone is prohibited.

Fourth, they increase the penalties under the Communications Act to make them consistent with the penalties for violating the Electronic Communications Privacy Act. Under the new penalty provisions, violators will be subject to a fine of $2,000, six months in jail, or both for a

willful violation, and these penalties increase for repeat violations.

Finally, they require the FCC to investigate and take action regarding wireless privacy violations under the Communications Act, regardless of any other investigative or enforcement action by any other federal agency. This provision will help ensure that these newly strengthened privacy protections are fully enforced in the future.

The millions of Americans who use wireless communications deserve to have their privacy protected. CTIA supports your efforts to improve the security of wireless telephone calls, and again I commend Mrs. Wilson and this Subcommittee for your work on the Wireless Privacy Enhancement issue.

End Quote

Read it carefully, it goes beyond PCS and Cellular.

They are distorting the issue of eavesdropping and radio scanners to scare the foolish!

It is wrong to restrict airwaves in a way that blames and punishes you and me instead of blaming and punishing the greedy cellular companies who, in the past, did not want to spend their money in secure cellular systems. Today, they have finally secured the cellular systems making radio-band blocking of scanners totally wrong. Reword the "Wireless Eavesdropping Protection Act of 2000" and reword the "Wireless Telecommunications Sourcing and Privacy Act" and amend the "Wireless Privacy Enhancement Act of 1998" to remove radio scanner restrictions because it is technically and logically foolish. Many other electronic devices can not be reasonably be controlled by American Constitutional Law and they receive cellular radio bands. Radio-band blocking and purposely closing Government radio traffic is not the American way.

Again they are, law after law, increasing the reception restrictions beyond cell phone communications into slowly closing government monitoring. In the past, part of Nazi law restricted radio reception with fear tactics to assure the growth of an evil empire. Their country developed into a prosperous society with the latest technology for their time, so their citizens did not care and government wanted to hide their wrong doings. The rest is history but it will try to repeat itself in a different form. In addition, Communist leaders love the idea of restricting citizens from monitoring them.

Hi Richard,

Nice posting. I would only add that using a non conductive mast will help only if the feedline is routed out the back of the antenna. Even though it is smaller in diamter than the mast it still has the possibility of being resonant at random frequencies and upsetting the antenna pattern. Stringing some ferrite beads at short intervals could break up these resonances.
It's been a while since I modeled LPDA's bit seem to recall that thier performance falls off rapidly on the low freq end, so I wonder about the TV antennas capabilities in the 150 MHz region. If the y do perform well, I suspect it may be a result of the VHFLO section performing at 3X freq- this effect is well known in LPDA's and those LPDA's with Vee shaped elements in particular.

Carl,

I read the news thread below and have a question for you. I bought a PRO 43 from someone on an EBay auction advertised in excellent condition. Once it arrived it was a different story. I opened it up and found the bad part. Are you guys discussing the RUBBER keypad or the electroinc circuit board that the rubber keypad touches?

I have created a web page for this one, but I really do want to repair this scanner.

http://www.gorio.com/badscan/keypad%20ic%20board.jpg

Thanks for your help.

Greg Williams

723. Re: Probe software

Newsgroup: rec.radio.scanner
Date: 2000-04-11 00:00:00 UTC
From: Larry Wilson <larry@spamcop.net>
Message-ID: <6KEI4.1241$fV.90279@bgtnsc05-news.ops.worldnet.att.net>
Source record: 90437

Well I to had the question is there a trial version available and wrote the author of Probe. He replied that he devoted all his efforts to the full working version and not "trialware" So after reading the reviews I bit the bullet and purchased Probe, I have not been disappointed, it does it all, it works. As Zombie Wolf stated "GOOD scanning software has never been cheap, and probably never will be......." Hence the saying "You get what you pay for"

Just my thoughts,

Larry...

Thanks for reading my post.

PRO 2021 200 channel base/mobile scanner, with mounting bracket/hardware,
screw in antenna, and manual, NO box. Has attached AC cord, and will
include DC (lighter plug) cord. Display light works fine. No mods done -
works and looks good.
Asking $80, including shipping.

If you have any questions, or are interested, please e-mail me.

One suggestion... A lot of vehicles have provisions for extra speakers
in the dash. In a lot of cases these aren't used.

Dodge Intrepids for example have an expensive Infinity sound system
that uses a center speaker in the dash. This slot is empty for all
other configurations.

The dash on the Intrepid 'pops' up with no tools. Just set a 3" speaker
in the slot (I had to trim the post to fit in the speaker I used, but I
used
one with a HUGE magnet.) and dropped a line down through to under
the dash. Once the top panel was reinstalled, the speaker was
invisible.

You cannot BELIEVE the difference it makes when you have a top
mounted speaker aimed straight up in the dash reflecting the sound
off the glass and back at you. I use mine for my dual-band ham rig,
not for a scanner.

Folks,

CTIA is moving fast -- fast enough that I'm taking off work
to write my letters THIS MORNING to make sure I get them ready
and out.

WRITE YOUR LETTERS! If you feel they won't make any difference,
WRITE ANYWAY! It certainly won't make a difference if you don't
do anything.

When you write, be courteous. Do not flame. Be consice as much
as you can. Stick to facts -- a "stretch" of the truth kills
your credibility.

I'll try to have a page available asap with respect to this issue...

Please don't sit on your duff and do nothing, unless you like the
idea of your volunteer firemen without radios, for example!

Eric

I have several Relm HS200 handhelds - they cover 800 MHz (up to956MHz) and
also have CTCSS. The radios are in excellent shape both cosmetically and
operationally and come with all original items.
They were used briefly with NASCAR communications until we switched to
satellite and no longer needed them.

Selling for $110 and I pay shipping in the US.

Here's a link for a pic and info:

> Jim...

Hi Jim,

Although I have no direct experience with the Grove splitter (technically, this device is called a diplexer), if properly designed the loss can be well below a decibel to both bands. A diplexer consists of a low pass filter (in this case for AM/FM b'cast) and a hi pass filter for VHF hi and UHF. Each filter has a series element as its input so it presents a high impedance (no load) to the other input.
I would not expect it to perform well at VHF-LO (30-50 MHz) as this portion of the spectrum would get sent to the car radio.

Do not confuse the diplexer with a broadband 2 way splitter such as that used in MATV/CATV- these have good port to port isolation but a pretty much flat 3 to 4 dB loss on both ports.

The BC780XLT is not a handheld unit. It is designed as a mobile unit. Will it take a battery pack? Still, it will do more that the BC245 and has some aphanumerics.

The VX-5R is a pretty poor HT. The old FT50RD is a better choice, though not much cheaper. The VX-5R CTCSS is unusable. The metal case makes the unit too hot to handle. It has other problems as well.

747. Signal Splitters

Newsgroup: rec.radio.scanner
Date: 2000-04-12 00:00:00 UTC
From: Jim Finney <jpfin@worldnet.att.net>
Message-ID: <38F3CC21.BD6DB566@worldnet.att.net>
Source record: 90300

Hello,

Anyone have experience with splitters that allow you to use your car radio antenna for both the car radio and a scanner? Grove sells one for $16.95. It is called a "Mobile Antenna Multicoupler with BNC Adapter, part number CPL63B". How much loss is introduced by using this device? Are they worth it?

Thanks for any info,

Jim...

Is there a scanner available that will receive and decode a digital signal?

Our State Police is changing from an analog signal to a digital signal over the same current frequencies and I need to know if there is a scanner that will decode their signal and do analog as well.

Thanks

Tim

YoGotmail, how original first off.

Answer is 'No', no such thing as digital scanner as yet.
Reason behind all this pretty simple 'Stop us from hearing them'

> >2. What kind of cable do I use to run from the antenna to the scanners?

use rg6 it has about the same great qualities as the hugh rg8 yet is smaller and very affordable, Home Depot has RCA brand 50 feet for $11, it comes with F plugs on each end, best to just cut them off and put the correct ends on yourself, buy the screw on or solder on plugs at radioshack or wherever you can find them. go to your public library and get a few books on scanners, they will cover this in detail.

> >3. Will the "T" adapter cause problems?? Signal loss?
yes, you should get a signal splitter designed for sharing antenna, they have them, and they do drop signal strength, compared to a separate antenna.

> >4. Can I have two scanners going at once and still have the same signal
> >distance as if I were only using one scanner?
> Probably not, but performance may be acceptable.

If that doesn't work, try using the roof antenna on the weaker of the signals you are monitoring, and just use your old antenna on the other scanner. Or put up 2 roof antennas, with $20 for the antenna and $11 for the coax, you are getting off pretty cheap.

I've used one for years with good reception in the scanner and the broadcast band radio. I can't give you any numbers but I live in a rural area and commute into a city that uses an 800mhz system. I'm happy with its performance in both areas. The biggest problem is installation. Getting to the back of the radio in a newer car or truck can be difficult. Also, if you have a GMC vehicle the Motorola connector on the antenna is smaller than standard. Not a big deal if you know about it before you have your dashboard dis-assembled. Adapters are available.

rg6 is fine and usually the best choice, scanners work fine on 50 ohm
cable, avoid adapters as they rob signal strength.

All,
He grabbing his marbles and going home as he does not like the rules. He can't be serious about he hobby or he would stay and help foster new hams into it. Hell he could even focus all that negative energy into going after the 35-55 crowd that have the money and leisure time to get into ham radio. So Vince are you going to do more public service to give back to the hobby or are you going to "sell out" and move over so us radio do goobers can't get more band space? I don't think you would be happy in any hobby as you are an old curmudgeon.

I've used two *and* three scanners with a mere splitter (I use the quad shielded RG-6 cable with simple 2 and 4 TV splitters) for years in the DC Metropolitan Area with acceptable results. Sure the potential for birdies exist, sure there will be signal loss, but I've not had any problems. Every so often, I would take the splitter out and run direct to a single scanner to see what I was missing. That would last about a week before the splitter was back in, and I was multi-scanning again. This is just my opinion, and we all have opinions, but it doesn't cost much to spend $2 or $3 on a simple splitter to see if that will satisfy you first. If it does, you will have saved multi $$$ from the higher cost devices that are designed to isolate and/or amplify the signal going to multi scanners. Even if you do like it at first, and don't like it later, you can still take a different route with minimal cash lost.

Just my point of view.

Selling my AR8200B, US version. It is in great condition but is missing the rubber dust cover over the power jack - it just fell off. The lower portion over the data jack is intact. There are no scratches or other cosmetic problems.

This unit has had additonal screening added by AOR and newer fimrware to resolve the low battery power-off condition. There have been no operational problems.

All original parts are included, and the following accessories also:

CC820 data cable
CT8200 CTCSS card
Discriminator cable (modified CC8200 in addition to the other CC8200)
Radio Shack AC selectable power adapter

Please email me with any questions you may have.

Thanks!

John Porter

Richard,
I have a PRO-2040 which I bought new in 1996 (at full price--ouch!). For $100.00 US the PRO-2040 is a good scanner, and I don't think you'll be able to get a new scanner with 800 MHz coverage for less money. Also, the PRO-2040 scans and searches at a very fast rate. However, be aware that the PRO-2040 is only a dual conversion scanner, and therefore is subject to receiving images and intermod, especially when used with a preamp or outdoor antenna. If you live in an area away from sources of strong VHF-UHF signals, then the PRO-2040 will be a good scanner for you. However, if you are close to a pager transmitter, cell tower, etc., you'd do better to spend a few dollars more and get a triple conversion scanner.

73,
David

Try the telescoping whip that Radio Shack sells for $9.99. I use the Rad Shack telescoping whip on all of my handheld scanners, and it provides a tremendous improvement in reception on all bands, especially VHF low.

774. Re: Radio Shack PRO-2040 - Any Comments ?

David,

Thanks for the reply. To be honest, my PRO-2034 is probably not even a dual conversion scanner, and so therefore the 2040 would be a step up !! 100$ US is about my limit for now, so it looks like I will go for it.

Mind you, the BC278CLT (refurbed from Rogers Communications) for $119US is not too much more and it has a clock radio.

Best regards,

Richard.

I use the RS telescoping scanner antenna too! It works great. You can
also use it for 2-meter and 440 amateur handhelds. Instructions that
is included tell you how.

I should have been more clear. The adapter I mentioned was a 300-75ohm converter found on most TV antennas.

The links are short-term only and don't work any more.

Here is a partial text of H.R. 34890, followed by an affected section of
the Communications Act, with insertions and deletions proposed in this
Bill. It may be necessary to use an 80 column or wider screen.

==========

H.R.3489 (partial text)

Wireless Telecommunications Sourcing and Privacy Act
(Introduced in the House)

SEC. 6. UNAUTHORIZED INTERCEPTION OR PUBLICATION OF COMMUNICATIONS.

Section 705 of the Communications Act of 1934 (47 U.S.C. 605) is
amended--
(1) in the heading of such section, by inserting `interception
or' after
`unauthorized';
(2) in the first sentence of subsection (a), by striking
`Except as
authorized by chapter 119, title 18, United States
Code, no person' and inserting `No person';
(3) in the second sentence of subsection (a)--
(A) by inserting `intentionally' before `intercept'; and
(B) by striking `communication and divulge' and inserting

`communication, and no person having intercepted
such a communication shall intentionally divulge';
(4) in the fourth sentence of subsection (a)--
(A) by inserting `(A)' after `intercepted, shall'; and
(B) by striking `thereof) or' and inserting `thereof); or
(B)';
(5) by striking the last sentence of subsection (a) and
inserting the
following: `Nothing in this subsection prohibits
an interception or disclosure of a communication as authorized
by
chapter 119 of title 18, United States Code.';
(6) in subsection (e)(1)--

==========

Text of 47 USC section 605 (partial) as modified.
XX ... XX indicates deletion of text.

<< ... >> indicates insertion of text

Sec. 605. Unauthorized

Added <<interception or>>

publication or use of communications

-STATUTE-

(a) Practices prohibited

Added <<No person>>

receiving, assisting in receiving, transmitting, or assisting in transmitting, any interstate or foreign communication by wire or radio shall divulge or publish the existence, contents, substance, purport, effect, or meaning thereof, except through authorized channels of transmission or reception, (1) to any person other than the addressee, his agent, or attorney, (2) to a person employed or authorized to forward such communication to its destination, (3) to proper accounting or distributing officers of the various communicating centers over which the communication may be passed, (4) to the master of a ship under whom he is serving, (5) in response to a subpena issued by a court of competent jurisdiction, or (6) on demand of other lawful authority. No person not being authorized by the sender shall

Added <<intentionally>>

intercept any radio

Deleted XXcommunication and divulge XX

Added <<communication, and no person having intercepted such a communication shall intentionally divulge>>

or publish the existence, contents, substance, purport, effect, or meaning of such intercepted communication to any person. No person being entitled thereto shall receive or assist in receiving any interstate or communication by radio and use such communication (or any information therein contained) for his own benefit or for the benefit of another not entitled thereto. No person having received any intercepted radio communication or having become acquainted with the contents, substance, purport, effect, or meaning of such communication (or any part thereof) knowing that such communication was intercepted, shall

Added <<(A) divulge or publish the existence, contents, substance, purport, effect, or meaning of such communication (or any part >>

Deleted XXthereof) or XX

Added << thereof); or (B) >>

use such communication (or any information therein contained) for
his own benefit or for the benefit of another not entitled thereto.

Deleted XXThis section shall not apply to the receiving, divulging,
publishing, or utilizing the contents of any radio communication which
is transmitted by any station for the use of the general public, which
relates to ships, aircraft, vehicles, or persons in distress, or which
is transmitted by an amateur radio station operator or by a citizens
band radio operator. XX

Added <<Nothing in this subsection prohibits an interception or
disclosure of a communication as authorized by chapter 119 of title 18,
United States Code>>

==========
Information:

From section 119, Title 18:

(g) It shall not be unlawful under this chapter or chapter 121 of this
title for any person -
(i) to intercept or access an electronic communication made
through an electronic communication system that is configured so
that such electronic communication is readily accessible to the
general public;
(ii) to intercept any radio communication which is transmitted -
(I) by any station for the use of the general public, or that
relates to ships, aircraft, vehicles, or persons in distress;
(II) by any governmental, law enforcement, civil defense,
private land mobile, or public safety communications system,
including police and fire, readily accessible to the general public;
(III) by a station operating on an authorized frequency
within the bands allocated to the amateur, citizens band, or
general mobile radio services; or
(IV) by any marine or aeronautical communications system;
(iii) to engage in any conduct which -
(I) is prohibited by section 633 of the Communications Act of
1934; or
(II) is excepted from the application of section 705(a) of
the Communications Act of 1934 by section 705(b) of that Act;
(iv) to intercept any wire or electronic communication the
transmission of which is causing harmful interference to any
lawfully operating station or consumer electronic equipment, to
the extent necessary to identify the source of such interference;

or

(v) for other users of the same frequency to intercept any
radio communication made through a system that utilizes
frequencies monitored by individuals engaged in the provision or
the use of such system, if such communication is not scrambled or
encrypted.

You may want to see if you can locate an Icom W2SRA. This handheld has 2 meter trancieve and a separately controlled 60 - 902 mHz scanner. I've got one I keep on the desk at work and am quite happy with it. These are older ht's, but have everything you need. They can be found on the swap pages or sometimes on E-bay. I got one from Lentini Communications, but they're gone now.

I recently bought one of the Radio Shack right angled telescopic set back antennas for my PRO-2034 scanner, and have found it to be worse than the supplied telescopic whip antenna. It seems to produce a noisier signal. I ave tried adjusting the length etc. but to no avail. Does anybody have any suggestions on a better set back antenna ?

Thanks,

Richard.

This is something else. There are resonators in your pager that
when the proper tones are decoded they open up the receiver for you
to hear your dispatcher. If you listed long enough you will hear
the other stations on that frequency.

This is really funny, the easier license testing is how this FOOL below
got his license in the first place. Now that exact same issue is why the
FOOL
is resigning.

Adapt or die to change. Time has largely passed the code by,
except in specialty areas like QRP, EME, and weak-signal DX.
Vince would rather pass blame and have his hobby "die"
than adapt and continue. So be it; it's his choice.

How much does Sony charge for the manual?(for the NON-PC version, although
either should do)-I could use the schematic(particulary the audio
section).

Actually, some questions I have are simple enough to post..
1.what is the impedance of the built-in speaker?
2.is there a dropping resistor in-line with the earphone jack?

837. FS: PRO-2021 & AEA-FAX

Newsgroup: rec.radio.scanner
Date: 2000-04-13 00:00:00 UTC
From: "Steve B." <scanfreq@istlaplata.net>
Message-ID: <xRiJ4.1227$bZ5.76727@news1.primary.net>
Source record: 90276

Thanks for reading my post.

1) PRO 2021 200 channel base/mobile scanner, with mounting bracket/hardware, screw in antenna, and manual, NO box. Has attached AC cord, and will include DC (lighter plug) cord. Display light works fine. No mods done - works and looks good.
Asking $80, including shipping.

2) AEA-FAX software version 2.6, (both 5.25" & 3.5" disks) and cable, with users manual, in original video tape cassette box. 16 gray level or false color. Can be
daisy chained with PK-232 or PK-88 to share the same com port. Also, it has on screen tuning display, and can run unattended and store images to hard disk.

Asking $25, including shipping.

Calling all radio scanner hobbyists!!

Last chance to take advantage of this special offer.
ScannerDigest is offering a FREE complimentary
copy of the ScannerDigest Newsletter to ALL scanner
radio enthusiasts.

Note:
Our email and postal address can also be found posted at:
<http://www.maxpages.com/frequencies>

Once there, just click on the hyperlink "FREE SCANNER DIGEST
NEWSLETTERS".

That's right, a no cost to you, back issue of our information packed
bi-monthly newsletter (booklet format) is available to any radio
hobbyist, just by requesting a copy.

Drop us a note, and tell us about you and your radio scanner
interests. If we receive your postal mailing address, we'll send you
an issue of our popular newsletter via USPS bulk rate mail.

Scanner hobbyists are a very diverse bunch. Do you belong to a group
or club? Are you in the private sector and use radios in your day-to-
day work? Perhaps you're affiliated with an agency. Maybe you are a
public safety scanner buff!

Those are just some of the many reasons to check out the
ScannerDigest newsletter.

Should you want to get to know us better, we will, in your newsletter
package include subscription information to the ScannerDigest, which
features the work of our fine cadre of scanner authors, who regularly
cover the frequencies, systems, and *other important* information on
equipment, tips, tricks, goings-on, and just about anything related to
scanning that, for various reasons, you won't see or read about on the
Net.

Hey, this is a great chance to review our valuable information
resource - just for the asking!

Source record: 90281

It seems that I need a scanner with the CTCSS. If this works by allowing
you to hear transmissions on a freq. that is being broadcast by a certain
agency such as the local fire or ems. I'm on a volunteer fire dept. and we
have "pagers" as they are called. That have two settings on them to hear
all traffic on the fire band or only when my fire dept. is dispatched. I
would assume that is how the "pager" works. Is this CTCSS in action or
something else. If you have a scanner with CTCSS would I be able to program
it to open the fire channel when the proper tone is sent for a fire dept.
and as many fire dept. that I program it for.

Thanks

I assume that dealers who have a large supply of the older BC245xlt's won't
be
mentioning the updated version until they have exhausted their supply. I
wonder
if they make their customers aware of the new version before they buy.

> with this radio?

I've had a YUPITERU-MVT7100 for almost a year and have no real complaints. The only thing that comes to mind that bothers me is the pre-programmed delay. There is a default 2 second delay before it resumes scanning after stopping on a frequency during scan mode, 5 seconds I believe if the delay function is selected?? Somebody may know how to get rid of this 2 second default delay?? unfortunately I have not heard of a way though??

Regards,

Pete.

I have the PC version, but I assume the non-PC version is the same except for the interface. If you are getting it for $99 (i.e. the J&R deal) it is a good scanner. At the original price, forget it.[I would insist on alphanumerics at that price.] My complaints are few. The squelch time constant is on the short side, so it occasionally flutters. The sound is too crisp. This is fine if the signal is clean (i.e. local), but annoying on weak signals. Actually, not very annoying, but just a bit annoying. Of course, the FM and TV sound are great thanks to the crisp audio. In fact, I can't think of a better WFM sound out of a scanner, but then again how much WFM do you plan on listening too?

You get AM,NFM, and WFM at any freq it covers, so miltary scanning is possible. That alone makes the $99 price a steal. I plan on using mine just for airshows, so who cares about alphanumerics. [Like you are going to lable BA1 for Blue Angels 1, etc...] You get 10 banks with 30 channels per bank.

One neat feature is the scratch pad. You can quickly go through the last 10 freqs with one button.

Thanks for reading my post.

1) PRO 2021 200 channel base/mobile scanner, with mounting bracket/hardware, screw in antenna, and manual, NO box. Has attached AC cord, and will include DC (lighter plug) cord. Display light works fine. No mods done - works and looks good.
Asking $80, OBO.

2) AEA-FAX software version 2.6, (both 5.25" & 3.5" disks) and cable, with users manual, in original video tape cassette box. 16 gray level or false color. Can be
daisy chained with PK-232 or PK-88 to share the same com port. Also, it has on screen tuning display, and can run unattended and store images to hard disk.

Asking $25, OBO.

Chill out dude.

This survey started out on a web board where people were talking about
who owens what scanners. The topic then switch to who likes what
scanners and someone then asked "Hey, on a scale of 1 -10 how do you
rate the different scanners you have used" So some guy decided to
compile all the stats about how people rate the different scanners.

I don't think that this is all part of some grand government plot to
catalog all the undesirable scanner owners for later internment in a
concentration camp.

Jeaze, if thay wanted to do that all they would have to do is drive
around in one of their microwave mind control vans. Then everyone
would call the secret 800 number and give the operators all the info.

True, but also remember that when ARRL proposed and later
got it's "Incentive Licencing" from the FCC, nearly 75%
of the USA based ham manufacturer's went out of business
in the following 2-Year period, and lost a full 40% of
their paying membership in the organization.

I know. I was *there* when it happened, and it does not
suprise me that the guy (callsign?) who was ARRL Pres.
at the time came up with this disaster from which the
hobby has >NEVER< recovered. (The ARRL President
at the time was also known as a red-nosed drunk,
along with some of the Board members. They nearly had
to CARRY him out of the 1966 or 67 Dayton hospitality
room... He was so LOADED with Seagrams and Old #7
that he couldn't walk more than 3 steps at a time
without falling on his face. All hail our fearless
leader! All hail Incentive Licencing! Pass me
another drink boy! -hic-hic-hic)

> Amsat is the only group moving

> HF in the early days.

Again true. But remember that AMSAT accounts for
0.8 percent of ham radio enthusiasts also. A drop
in the pond. This is a gem in the rough. If the AMSAT
boys could come up with a way to couple *wireless*
internet access with HamSats, THEN you would see some

interest in young people in ham radio.

Nahhh, it will not happen, too many folks want
stupid mores code and are bitchin and moaning
about April the 15th of 2000 or something.
Status-Quo, Same ole s--- different day.

> The ARRL has been talking bull out of both
> sides of its mouth and the whole thing has
> been a smoke screen money-grab, and it has
> suckered in alot of hams over the last year.

Not really, their membership stats are dropping
about 5% (or more) per year. The old standby
crowd is dying off. 15 per month to 1 new member
joining. This is what's called a revenue disaster.

All they're interested in is keeping their
ivory building well-covered in English Ivy
and those nice advertising revenue checks
rolling in the mail from the "Big-3"
Jap radio builders, and QST subscriptions.
Hope they have a big marble stone to plant
on Main Street in Newington in a Year or two...

> The League says it's moving ham radio
> forward, but I haven't seen any proposals. The League says
> gaining more hams by removing some exam elements will
> advance ham radio, they said the
> same thing about the no-code tech which didn't
> advance a thing.

Correct! And add to that as long as code is required for ANY
class of radio licence, you will never attract new
people. Code is about as relavant today
as buggy whips, horseshoes and dial-type telephones.
Come to think of it, much of ham radio is just as outmoded
too.

> Make it harder to be a ham and those that
> make it will certainly have the initative to
> move the service forward and protect it.

Yes, I am sure all EIGHT of the new hams will!

Guess what, you just >re-instituted< Incentive Licencing!

HOW the phuck does this keep re-appearing? It boggles my
mind why Hams are so addamant to think that making something
harder will somehow *increase* both quality and quantity. I don't
know about you, but between work, kids in college, time wasted
in commuting, weekend chores, soccer games for the
youngest etc etc I am lucky if I talk an hour-a-day on 2M

and this mostly while waiting in traffic on the Interstate.

Tell me, HOW is someone going to make time for code and other arcane stuff to get an ham licence, when for FAR LESS MONEY, they can pick up a Pentium-III computer and be "Plug-and-Play" on the Internet with RealAudio and a gazillion webpages and chatrooms to select from?

Finally, about 2 Meters.. HA HA HA!!

You can get a *pair* of Family Radio Service UHF walkie-talkies from Motorola for about $120.00 No Licence. No learning code. No test. No problem. Put 3 "AA" batteries in, and your on the air with 13 channels and 32 PL tones to choose from. (MUCH cheaper than 2 Meter rigs)

FACE IT GUYS HAM RADIO IS IN IT'S DEATH THROES. THE ARRL KNOWS IT, AND SO DOES EVERYBODY ELSE. Hamfests are being canceled all over, people AIN'T comming anymore. Dealers AIN'T comming out anymore. It a non-stop ride down the technological whirlpool of history. Used to be that ham radio was UNIQUE. To talk to someone in Europe or make a phone call from your car used to be something new and interesting. Today, you can do all this on the Internet and via cell phones and FRS radios.

FACE IT boys, ham radio IS as OBSOLETE as a vaccum tube television set is in the Year 2000. Enjoy it for the next 10 years at the most, before it's relagated to the antique shelf display in a dusty corner at the Smithsonian.

And that, my friends, IS the real TRUTH.

Use the mag-mount & run the cable in thru the door -
the weather-stripping around the door is plenty
flexible enough to close the door on it without
crushing the cable - I use it like that, and it works
fine...

This is what I have been using in Cleveland County (Oklahoma) and have gotten very little traffic and can only assume it's because they use conventional radio mostly. Can you add/verify I have all the freqs. and IDs?
-Thanks,
Erich

I've heard there are new easy requirements for ham licensing as of 4/15/00.
I figure it is time to apply.

Where can I get the new study material?
Where near San Jose California would I find an examiner?

Thanks in advance,
Dave

Scanners Unlimited have them in stock.
It takes a few weeks after Scanners Unlimited receives them to
circulate around. Also, some companies may want to sell all their old
245's before they sell the new ones.

You can change the delay to 2, or 5 seconds, or turn it off. You can turn the beep off. You can punch in any frequency by the number pad and hit exe button and you are there! To listen or program it. It can skip up to 100 frequencies while scan/searching, and you can call up the list and edit it at any time!

You are right, that is exactly the point. Being a ham myself for 30 years, that is my feelings. Why fight something I wish they had done 30 years ago. The good ole boys at the frat house(ARRL) did a fine job of keeping out many by using the code to weed out the underlings. Some of us think ham radio ranks right up there with world hunger or a cure for cancer. The better informed of us do know this is not true. I will continue to enjoy my hobby of radio and use morse code and phone and it will be better than before.

>Thanks,
>Al
>
Power saver set at 1:4 Radio looks for a signal for 125 milli seconds
then " sleeps " for 500 Milli seconds.

Power saver set at 1:16 radio looks for a signal for 125 milli seconds
then "sleeps " for 2 seconds.

Trade offs are missed syllables or words for longer battery life.

Gary

Well, Since it's my first handheld I don't have much to compare it to.
But I think it is WELL worth the $100 I dropped on them. (I bought one
of each)

At first I thought programming them was a little more complicated than
it needs to be, (I have two unidens and a radio shack) but after using
them for a couple of days, I don't have a problem with it. It even makes
some sense.

I LOVE the intelligent memory! I can't tell you how many times I've been
searching and come across an interesting frequency, and before I can get
to the radio to stop the search, it's moved on. No more of that.
(assuming the broadcast was over 5 seconds)

I haven't even fired up the software that came with the PC version yet.

I do have one gripe. The radio doesn't tell you if you've already
programmed a frequency. This is a pretty basic feature I think. (even my
cheap 50 channel radio shack does that)

CTCSS works fine on the VX-5R. The repeater I use has CTCSS access,
and I have no trouble accessing it with the VX-5R. The metal case is the
heatsink for the radio. If it gets too hot to handle, it is telling you to shut your
yap and let the other fellow talk for a while. You probably timed out the repeater
several minutes ago anyway.

Not necessarily. It may just mean that current models
are adequately addressing market demand. In other
words, there's no reason to bring out a new model if
the old model is still selling well.

>Is there anything, handheld, that will replace these
>two units? Anything at all in the pipeline??

Rumor has it that Motorola is returning to the ham
market. If so, we can expect a bulletproof radio which
doesn't try to be a DC to daylight noise box. I'd be
delighted with a new radio that had stout helical
filtering in the front end which would stop cold any
signal from outside the ham bands getting into the
radio.

894. 6 inch duckie vs. the Telescoping whip.

Newsgroup: rec.radio.scanner
Date: 2000-04-14 00:00:00 UTC
From: grif@NODAMNSPAM.gci.net
Message-ID: <MPG.1361ae301e1cde129896a2@news.gci.net>
Source record: 90183

I have a RS Pro-39 handheld. It comes stock with a rubber duck about 6in. long. A freind of mine has gven me a telescoping whip which was originally stock for a handheld CB radio. I have installed the whip but am unsure if it is improving performance. I would like to know the theoretical benefits of using the whip over the duck. The whip is approx 5 inches unextended, and approx 27 inches extended. It appears to have a center loaded coil, but I am of the opinion that the coil looking apparatus is for "looks" due to lack of weight, and it appears to be made of hollow molded plastic.

What is the best way to test what lenghts the antenna should be for a given freq? What is the rule of thumb for high freq vs. low freq antenna length? I mostly listen to about 450.0000 thru 465.0000 for police bands and the 800's for mobile/cell. I have documents for other local freqs, but have been unable to get much traffic.

Any help would be appreciated,
Thanks.

Hi,

Jeese, I know it! .. They just don't understand what they are using is another "non-wired" (cb-type) radio transmitter. The rest I think do know it and they'll say to a caller ... are you on a cell or cordless phone? I've had many people ask me if I was using one ... hehe!

A lot is being done to mess up scanner listening, but this in noway stops the placing of fm tramitters (bugs) and such devices in a person's home or office. Those who want private information on one's business or affairs, won't be looking to cordless or cell phones for it, they have other ways of getting it.

About 2 weeks ago, a friend in Maine told me he talked to a private-eye when he was
away in Florda. They talked about cell phones and all that sorta stuff. The PI said
"When someone with the Government wants a private conversation over the wires,
"They use secure lines". My friend asked .. So normal (wired) phones are not really
secure either? The PI answered with .. well, not always and then laughed. We all know
lines can be tapped, but one can't help but wonder .. what else can be done.

Yup, I agree with big changes are coming for the Internet.
We all know that sending email is no different then sending postcards.
PGP is a hot topic .. They say, The Gov has no back door to read pgp messages. Yeah right ... I for one do not believe it.

Seems to me, if I remember correctly .. Bill Gates in Time Magazine said something like "Well, if I can't own all those Internet computers out there, then maybe I should look into buying the satilites". A wireless world where not Bill Gates, but Government / Governments, have full control of the satilites, cell-systems and all else. Now theres a thought.

Anyway, Big business is big money and those guys building and installing ASTRO systems
and such, will do their very best to convince various services they NEED it. Afterall, they are
pushing / selling a serurity - Product. Why so much security though? There is more to this then
just some people listening a scanner. IMHO.

What don't we know? Well, you can bet its lots and if we knew it would most likly blow our minds,
but it sure as hell won't surprize most us.

Best!

Mark

Keep in mind that Narrowband does not necessarily mean digital. A good number of the analog radios on the market today are capable of operating with 12.5 kHz deviation.

>
> There are rural areas still using VHF Low band for public service. I
> think that only an FCC mandate would make some of these operations

>

I agree; there are a lot of systems in rural areas that will probably not go anywhere anytime soon. However, more and more rural police depts. may turn to digital high-band and UHF systems for mobile data capabilities. The more computers continue to get integrated in people's daily lives, the more digital will become desirable.

>
> On the other hand, in urban areas where trunking has been put into play,
> I think an ultimate move to digital is inevitable. I don't however,
> think it will mean the end of our hobby.

Maybe yes, maybe no... I think the jury is still out on this one... A major factor will be how expensive it will be to buy and maintain the encryption features. Make no doubt about it, radio manufacturers see encryption as an opportunity to make more money. Furthermore, once the system is deployed, key management is likely to become a headache on large systems and many users might deal with it by just turning it off.

> There will still be users of
> digital radio systems whose reason for going digital are for decreased
> bandwidth, not for security. These users might not encrypt their
> throughput.

See my first comment above.

> Of course, it is highly likely that any such system would be trunked.

Not necessarily. I know of one very large [non-public safety] wide-area digital system going in today that will not be trunked. As some users start to move dispatching from voice-based systems to computer-based systems, voice, in some cases, will take a back seat to data. The nice thing about data on a TDMA system is that it can send data in between voice transmissions.

> I do worry about trunked systems (digital and analog both) in event of
> verious sorts of emergency. What happens if a the
> repeater/network/power/whatever gets knocked out? The rural systems
> like I described three paragraphs ago will still be running. This
> should be a vital consideration in public service.

I won't say trunked systems are immune to failure, but generally systems can cope with the loss of a single channel and in some cases, connectivity between a repeater site and a central control site. (In the latter type of failure, wide area connectivity may be lost but local communication will still work.) Furthermore, generator backup is mandatory on most critical systems. Again, there are exceptions (usually poor implementations that haven't had the bugs worked out) but trunked radio systems are amazingly resilient.

Also, a properly designed system will have a talk-around channel for simplex operation in the event of a complete failure. However, most users, once accustomed to the increased functionality of a trunking system, will probably fall back to cell phones as a backup (assuming they're available); they won't bother with the poor coverage and lack of channel availability of a purely simplex system. Cellular does not work well for dispatch, but it will work in a pinch.

in a work, awesome! it has really continuous from 25 to 1.3 except cell, and it is clear as a bell triple conversion, side by side my pro-43 it picks up more stuff and easier to understand. the control buttons are huge, for a big white man's hand and not a jap hand. The display is huge and easy to read and lights up for about 20 sec. when you hit the big easy to find button right next to it--plus if you are using adapter power the light stays on. the programming and limit searches are totally different from any other I have seen and have to be learned. Instructions are great and not too long winded or too technical. You can change the steps and detection modes. you can search preset bands of like 25 to 30, and all the police and fire and wx and marine are preloaded like the hybrid unit bc350 uniden bearcat. Plus it does wideband fm, and has preloaded the fm radio band and all tv stations, so you can listen to Barney at work! it has skip feature for avoiding the hang during a search. It comes with ac adapter. it has 300 channels. it has an intelligent memory that remembers frequencies you have stopped at. it is worth at least $200.

You should TAKE HEED and BE VERY CAREFULL about what you admit to on the newsgroups....they are monitored by big brother. Please read the following:

John T. Ward posted an article on USENET about the following article which appeared in the Friday, April 2 issue of NY Newsday newspaper, page A31.

Feds: Man Eavesdropped on Police / Agents say he posted cops' info on Web site
By Hugo Kugiya. STAFF WRITER

The U.S. Secret Service and Nassau County police arrested an unemployed electronics enthusiast from Kings Park after he intentionally intercepted communication sent and received by the mobile data terminals installed in police cruisers, federal agents said.

Keith Knipschild, a former NYNEX employee, was arrested Wednesday in his home at 29 Amapola Lane for intercepting information and posting some of it on his Web site, http://www.knip.com, agents said. Police use mobile data terminals to check for outstanding warrants, review driving records and to send emergency information they might not want to broadcast across police scanners, such as details of an ongoing surveillance or a planned search.

An affidavit from a federal agent found that Knipschild's Web site had 93 pages of police transmissions from March 12, which included criminal histories and warrants, motor-vehicle checks, medical information about victims, and witness statements. Nassau police confirmed the information was transmitted by police on that day. Investigators say a confidential source led them to Knipschild, who could not be reached for comment yesterday.

Federal investigators said three satellite dishes, ranging in size from 18 inches to 12 feet in diameter, as well as a 40-foot radio tower were discovered on Knipschild's property. Calls to federal authorities seeking comment were not returned yesterday. Details about the disposition of the case were not available.

Federal documents indicate Knipschild's Web site includes information of interest to electronic enthusiasts, with links to Web sites about scanners, satellites and dishes, and amateur radio.

Federal investigators said Knipschild used an illegal electronic device to intercept police communications. In a related case, the Secret Service have arrested a San Diego couple, Bill and Cindy Cheek, on a New York warrant charging they sold such illegal devices on the Internet to intercept police communications. The Secret Service said one of its undercover agents purchased a device from the Cheeks, who shipped it to New York. Details were not readily available yesterday.

Mobile data terminals send and receive information by radio frequencies, which are encoded into a digital or binary format, one that is not available to the public. Furthermore, these terminals are password-protected.

Marc,

Answers to your questions are:
1) It doesn't say
2) 47 Ohm resistor in line with the earphone jack

I'm a beginning electronics student (self-taught) so perhaps if you can guide me a little with the schematic, I can find out further info. Also, I can scan & email the relevant sections.

Regards,
Peter

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH6O, jeffreyh@hawaii.edu, or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any amateur radio-related message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the

group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec.radio.info-moderator@primenet.com. Inquires and other adminis-trivia should be directed to rec.radio.info-request@primenet.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas. PLEASE BE SURE TO SAVE THE WELCOME MESSAGE YOU RECEIVE AFTER SUBSCRIBING -- IT WILL CONTAIN IMPORTANT INFO REGARDING UNSUBSCRIBING!

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send an email to cq-contesting-request@contesting.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to: majordomo@piobaire.mines.uidaho.edu and only write: subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

We now have a list devoted to amateur radio history. To subscribe, send an email to: ham-radio-history-subscribe@egroups.com - leave the body of the message blank.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see the excellent web site http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's

headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

That's what I didn't like about the glass mount. I found the regular mag mount "scanner" antenna from RS had better overall coverage. If you're going for anything below the aeronautical band I'd avoid the glass mount, cellular type antennas.

Did you simply mail the credential back to the VEC or did you
include a letter specifically requesting that you be disaccredited?
Simply returning the credential may not do that. If you really want
to make sure you are disaccredited, mail your license back to
Gettysburg with a letter requesting that your amateur license be
cancelled. Once you can confirm that your amateur license has been
cancelled, you can relax because you are no longer qualified to serve
as VE and the VEC's accreditation will be moot.

I am sure this has been covered. I heard that MDT freq for a local trunked system are probably going to be in the same range (if not the same frequencies) as the trunked freq in use now. However, the units who have the MDT in them have a 'whip' (strait) antennae on them now (in addition to the old 800 meg coil antennae). Aren't the whip ones usually used for 400 mhz freq or is this a new twist. I eventually want to monitor the MDT traffic using my scanner (I have a pro-90 and pro-91) .

I am up to 110 scanner survey returns. A pretty good number, but that still means only 2,3 or 4 reviews per scanner model. Not enough for good data and statistic graphs.

IF YOU HAVEN'T DONE SO, please help us out by going to the SCANNER SURVEY PROJECT website and take the survey.

rec.radio.scanner ftp archive on the official USENET FAQ
library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article discusses the purchase of used scanner radios
and includes these topics:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase
most of my receivers at hamfests or horsetrade with other

radio hobbyists.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Radio Shack repairs scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

You may be able to obtain manuals for older Midland scanners from:

Midland Consumer Radio Products
1670, North Topping,
Kansas City,
MO: 64120

Phone: 816-241-8500

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series (see US patent 4,011,515, granted 3/8/77). Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the

scanner in binary form. Some models, like the Tennelec MCP-1 (see US patent 3,961,261, granted 6/1/76), Bearcat BC-101 (see US patent 4,179,662, granted 8/4/78), and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. See US patent 4,057,760, granted 11/8/77. The GRE-manufactured SBE Optiscan (and its Sears clone) required poking or covering a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000, R7100, and R8500. The ICOM models

are more "communications receiver" than a conventional scanner.

For portable use, I prefer Uniden/Bearcat BC3000XLT and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

Electra Corporation stocks crystals for the Bearcat scanners:

Electra Corporation
11915 E. Washington St.
Cumberland, IN 46229
Phone 317-894-3229

Crystals for Bearcat and other models are available from:

The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.]

I am often asked, "How do you find these frequencies?"
This article answers the question in various sections:

Books
Magazines
Government Records
Web Sites
Federal Radio Stations
Radio Clubs
Do Your Own Sleuthing
What Makes Station Identification Difficult?
Examine the FCC License on Premise
Examine the Labels on Radio Equipment
Examine the Antenna to Determine Frequency Band
Equipment to Determine Frequency Usage
How Can I Determine To Whom I'm Listening? - An Example
Summary
Addresses

Books

The most convenient source of fire and police frequencies is the Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and

larger book stores for under $13. Police Call Plus is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. A few pages of local airport and nonsensitive federal government frequencies are included. Selected business frequencies are listed, too, but without callsigns and other details.

I highly recommend Richard Barnett's book, Monitor America, published by Scanner Master Corp. A 3rd edition is available from Grove Enterprises for about $30. It is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the Radio Communications Monitoring Association (RCMA), now defunt. Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call Plus, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The longstanding source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It

is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and the sensationalistic Popular Communications magazines.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM instead.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100.

The PerCon Spectrum CDROM sells for under $30 and contains a handful of fields for every FCC license in the US. However, Public Safety license information contained in the Winter 1996 Spectrum doesn't appear as up to date as in the 1997 Police Call Plus.

Spectrum works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at

http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)

dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes and extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Web Sites

If you have access to the World Wide Web, you can visit dozens of sites with local frequency lists. You can look up civilian aero frequencies for specific airports at: http://www.airnav.com/airports/.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'. (See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information

is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA), now out of business. There are several regional scanner clubs, spun off from the former RCMA, which hold regular meetings.

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available on the WWW page http://aosc.rpmdp.com and from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the

channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75

recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel

pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Examine the Antenna to Determine Frequency Band

You can often determine a transmitter's frequency band by the size and type of antenna used.

The Police Call Plus book contains sketches of antennas. Antenna catalogs are crammed full with antenna pictures and specifications and they are usually free. Contact Antenna Specialists (216-349-8400), Cushcraft (603-627-7877), Tessco (800-472-7373), Maxrad, Larsen Electronics (800-426-1656), and other companies in the land mobile equipment business.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found

during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my

shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA.
High level overviews of the following topics are presented:

Why Scanning?
Is Scanning Legal?
What Scanner Should I Buy?
What is a CTCSS and DCS Tone Squelch Feature?
How Do I Determine the Proper CTCSS or DCS Code?
Scanner Antennas
Coaxial Cable Feedlines
Where Can I Buy A Scanner?
Modifying Your Scanner
Scanner Repair Shops
Where Can I Obtain Frequency Information?
Do Your Own Frequency Detective Work
How Can I Use Equipment to Uncover New Frequencies?
Scanner Clubs and Mailing Lists

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,

taxis, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, neighbor and domestic disputes, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a team of G-men protect the president while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies.

It is illegal for companies to sell or import into the USA recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

The rules define "readily altered by the user" as "clipping the leads of, or installing, a simple component such as a diode, resistor and/or jumper wire; replacing a plug-in semiconductor chip; or programming a semiconductor chip using special access codes or an external device, such as a personal computer."

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations and the AR5000 works well.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. Beware of low cost programmables which can't search. Some models, like the early Uniden SportCats and Radio Shack PRO-2046, allow searching between limits, but the limits are factory programmed and cannot be altered.

Get a model which covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 50 channel scanner will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate. The $1500 Icom R8500 and $2000 AOR AR5000 models are exceptions.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC895XLT, BC245XLT, SC200, and Radio Shack PRO-91 and PRO-94 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites. The ICOM IC-R2 and Yaesu VR-500 are the two smallest "pocket" scanners which perform. Both are tiny enough to fit comfortably in a shirt pocket so you can monitor without attracting undue attention.

Looking for value? At $170 discount price, the 100 channel Uniden/Bearcat BC278CLT base is a good value and available at most Sears and Best Buy stores. The Uniden Sportcat SC200 portable performs very well is an excellent value at its $220 street price.

CTCSS and DCS Tone Squelch Feature

Upscale scanners can be optioned with a subaudible tone decoding squelch circuit. There are two types: CTCSS (Continuous Tone Coded Squelch System) and DCS (Digital Coded Squelch). In simple terms, this feature lets your

scanner ignore signals you don't want to hear.

Most land mobile two way radios, except trunked systems, transmit either CTCSS or DCS signals subaudibly along with the voice information. U.S. military field radios employ wider deviation and a 150 Hz CTCSS tone, not supported by most scanners or CTCSS decoders.

There are over 40 different CTCSS codes and you can program a specific CTCSS or DCS code into each memory channel. Using a CTCSS or DCS decoder permits your scanner to open the squelch only if the transmission has a code which matches the code you program.

CTCSS and DCS decoding offers several advantages:

1. Ignore unwanted signals on shared frequencies: It is common for several users to share the same frequency, e.g., my county sheriff uses the same frequency as Chicago Police, located about 60 miles away. I want to hear my sheriff's transmissions but don't want the scanner to stop on or listen to Chicago Police transmissions. This is especially a problem when radio propagation is good, e.g., during a "band opening," when reception range is temporarily increased.

2. Combat intermodulation interference: Helps keep out intermod and image interference from strong pagers and other signals which are not transmitted with a matching code.

3. Ignore scrambled transmissions: Many federal law enforcement agencies (FBI, Secret Service, etc) and some local police agencies employ digital voice scrambling, which sounds like white noise and is annoying to hear. The CTCSS or DCS code is sent only when the station is transmitting unscrambled, or "in the clear." You can program federal frequencies along with the proper code into your decoder-equipped scanner so you won't have to listen to the scrambled mess and only hear their transmissions when they are unscrambled.

CTCSS also goes by various tradenames: Motorola's PL (Private Line), GE's Channel Guard, and RCA's Quiet Channel. Motorola uses the tradename DPL (Digital Private Line) for its digital coded squelch.

How Do I Determine the Proper CTCSS or DCS Code?

There are a few ways to determine the CTCSS or DCS code transmitted by a station:

1. Use an outboard CTCSS/DCS reader which must be attached to the discriminator output circuitry inside the scanner. The reader has an LCD or LED display which indicates the code when a station transmits. I use a CSI model CD-1 Communications Decoder Unit, an an excellent reader which sells new for about $200. (Connect Systems Inc., Ventura, CA, 800-545-1349, http://www.connectsystems.com).
2. Many of the ScannerMaster guides, as well as scanner club newsletters, print the CTCSS codes used by transmitting stations.
3. On some scanners equipped with the CTCSS squelch, you can program into memory the frequency of interest. Then you "tune" slowly through all the different CTCSS and/or DCS codes until the squelch opens and you hear the dispatcher talking. This is a slow process and the station has to keep transmitting during it.
4. A slow, brute force method is to program the same frequency but a different CTCSS code into several channels and see where your scanner stops.
5. In some cases, I've actually examined the walkie-talkies I want to monitor and found the CTCSS code printed on a label on or inside the radio.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer these alternative antennas for use with portable scanners:

1. The Icom FA-1433B dual band flex antenna, a thin and very flexible rubber antenna, is slightly longer than a stock heliflex but provides better performance. The Premier (Prime) RD-9 and RD-9SMA are about the same length but even thinner.
2. The Austin Condor is a 12" long rubberized antenna available for about $30. While considerably longer than the stock antenna and the FA-1443B, the Condor is very flexible and provides VHF-high band reception superior to both. It is not designed to cover the VHF-low band, but will allow reception there at least as good as shorter antennas. The Austin Condor is available from Grove Enterprises.
3. The "Thin-Stick" is an 18 inch telescoping antenna for extended range. It is made in USA by Smiley Antenna Co., Inc. and is designed to cover both the 2 meter

and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A (available from Amateur Electronic Supply) or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 50 miles or more, depending on terrain. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U, e.g., Belden type 8267, has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Be sure it is on sale, as Radio Shack list prices are high and their scanners are offered at reduced prices by mail order discounters.

Discount chain stores like Wal-Mart, Best Buy, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902. For a free catalog, call (828)837-9200. Telephone (orders only): (800)438-8155. Web page is http://www.grove-ent.com

- National Electronics (formerly National Tower Company), PO Box 15417, Shawnee Mission, KS 66215. Telephone (800)762-5049, (913)888-8864. Web page is http://www.sound.net/~ne/

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411. Web page is http://www.aesham.com

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. Modifying any scanner to receive cellular phone signals is now considered illegal. By federal regulation, new scanner models must be designed to they cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/hamradio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the

Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here is one company which repairs scanners:

- G & G Communications (telephone 716-768-8151) - (http://www.iinc.com/ggcomm or email ggcomm@iinc.com or ggcomm@aol.com) This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 7825 Black Street Rd., LeRoy, NY 14482.

Repair tips for Bearcat and Radio Shack scanners are discussed in two other FAQ articles.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores. The newest editions contain abbreviated business listings, too, although callsigns and other details are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial

broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 828-837-9200, http://www.grove-ent.com) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning (NatScan) is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the

public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM. The PerCon Spectrum CDROM sells for under $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM, too.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)

dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes an extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an

invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at

the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs or Mailing List?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

Clay Irving <clay@panix.com> administers a scanner electronic mailing list, called "scanning." To subscribe, send an Email message to: majordomo@lists.panix.com

In the body of the Email message, put: subscribe scanning

Other scanner mailing lists include: scanner@onelist.com, scan-l@onelist.com, scanner@qth.net, and sonofrcma@onelist.com.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about

4 PM. You must purchase a lunch since we get the room for

- 2 -

free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. You can obtain an electronic subscription to the CARMA Newsletter. For more info, see:

http://www.TheRamp.net/shabec/carma.htm

The club's mailing address is:

CARMA
P.O. Box 2681
Glenview, IL 60025

All 1999 meetings (except August) will be held on Saturdays at Phillies Pizza, 6300S. Kingery Highway, located in the shopping center at the corner Rt. 83 and 53rd St. in Willowbrook, IL,

The 1999 meeting schedule is: April 3, June 5 (picnic at Argonne National Labs), August 7, October 2, and December 4.

The CARMA Picnic will be June 5th, 1999 at the Argonne National Labs Picnic Pavilion, Cass Avenue, south of I-55 in or around Darien or Lemont. The picnic will start whenever someone arrives. The regular meeting will be in the Pavilion at 1:00 PM. If the weather is totally frightful we also have a room inside the Laboratory building available for us.

The Picnic is BYOE (Bring your own everything) If you want to eat or drink, bring it with you, as well as your BBQ or six pack.

HAMFEST/COMPUTERFEST CALENDAR 2000 - ILLINOIS
last updated March 27, 2000

o Please report additions or changes to Bob Parnass, AJ9S, office phone: (630)979-5414, electronic mail: parnass@bell-labs.com. Thanks to Dennis Dale, Rick D. Wilson, John Wass KA9QJX, Tom Harker, and ARRL for providing some of the information.

APRIL 2000

Apr 2 (Sun): Wheaton, IL - Giant Computer Show & Sale (see below). DuPage County Fairgrounds, County Farm Rd. & Manchester Rd. 9:30 AM - 3 PM. Adults $6, children $2.

Apr 7-8 (Fri, Sat.): Milwaukee, IL - AES Superfest at AES Milwaukee store, 5710 W. Good Hope Rd. 2PM-7PM. (Fri.), 8:30AM-4PM (Sat.) 35 manufacturers. Free Admission, manufacturers reps, flea market, forums, as well as store specials and closeouts. Also Radio Recyclers next to AES. For further info call Ray at (414) 358-4088, email at raykhk9w@aol.com or check out the Web site at http://www.aes/jam.com

Apr 9 (Sun) - Stoughton, WI - Madison Swapfest. Mandt Commumity Center, Stoughton Junior Fair Grounds, Stoughton WI. Doors open at 8AM. Tickets $5. talk-in on 147.15 repeater. Info: write to (SASE) MARA, Box 8890, Madison, WI 53708-8890. Swapfest Info Line (608) 245-8890 24 hrs/day. http://www.qsl.net/mara

Apr 15 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Apr 16 (Sun): Orland Park, IL - Giant Computer Show & Sale (see below). Orland Park Civic Center, 147th St. & Lagrange Rd. 9:30 AM - 3 PM. Adults $6, children $2.

Apr 29 (Sat): Stickney, IL - DuPage ARC. Hawthorne Race Course, 3500 S. Cicero Ave. Admission $6. Talk-in 145.25 repeater. http://www.w9dup.org, Info: Ed Weinstein, WD9AYR, 7511 Walnut Avenue, Woodridge, IL 60517. Phone: 630-985-9256. Email: DARCHamfest@aol.com,

Apr 30 (Sun): Arthur, IL - Moultrie ARK. Info: Ralph Zancha, WC9V, PO Box 55, Lovington, IL 61937. Phone: 217-873-5287. Email: rzancha@one-eleven.net

Apr 30 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

Apr 30 (Sun): Galva, IL - W9YPS Hamfest, Area Amateur Radio Operators club. Galva National Guard Armory. Morgan Rd. Admission $5. Info: Phil IMes, WD9IRE, kewphil@cin.net or Bill Anderson WA9BA, bill@inw.net

MAY 2000

May 6 (Sat) - Cedarburg, WI - Ozaukee RC Hamfest, Circle B Recreation Center (St. Hwy 60 and Ozaukee Cty I) Admission $4. VEC Exams 9AM-Noon. Info: AA9HR (262)377-2137 (6PM-8PM), email aa9hr@execpc.com or write O.R.C. Swapfest Committee, 1702 Holly Lane, Grafton, WI 53024

May 7 (Sun) - Sandwich, IL - DeKalb Hamfest; Sandwich Fairgrounds (intersection of Suydam and Gletty roads). 8AM - 1PM, admission - $6.00, 2 indoor buildings. No VEC testing. Talk-in on 146.730/- or 146.520. Info: W9ICU at (815)895-3219, email W9ICU@tbcnet.com. http://tbcnet.com/~jleonard/hamfest.htm

May 13 (Sat): Manitowoc, WI - Lakeshore Hamfest, Mancorad RC. Manitowoc County Expo Center, intersection of HWYS 42-15 and I-43 on County R. Starts 8AM. VEC exams at Silver Lake College, Hwy 151 West (regestration closes at 9 AM). Admission $5. Talk-in 146.61/-. Info: Red (920)684-3733 or Fred (920)682-9264. Mancorad Radio Club, P.O. Box 204, Manitowoc, WI 54221-0204.

May 19-21 (Fri-Sun): Dayton, Ohio - Dayton Hamvention; Hara Arena. Admission $22 (advance - $16) for three days; talk-in on 146.94/- , 146.91/-. Biggest hamfest in USA. Info: call (937)276-6934 or write Hamvention, Box 964, Dayton, OH 45401-0964. Email: info@hamvention.org or see web page http://www.hamvention.org

May 20 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

May 21 (Sun): Wheaton, IL - Giant Computer Show & Sale (see below). DuPage County Fairgrounds, County Farm Rd. & Manchester Rd. 9:30 AM - 3 PM. Adults $6, children $2.

May 28 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College

Rd. 9:30 AM - 3 PM. Admission $6, children $2.

JUNE 2000

Jun 4 (Sun): Princeton - IL Starved Rock RC. Bureau County Fairgrounds. Exit 56 from I-80. Admission $7 (ouch!) at gate. Talk-in 146.955, -600, PL103.5 Hz. info: AL Erbrederis, tel. 1-815-498-9675, 262 Easy St., Somanauk IL.60552. ERB.N9PIB@juno.com. http://www.qsl.net/w9mks. E-mail: w9mks@qsl.net. (Usually an excellent hamfest. Unlimited space outdoor flea market, some indoor space, though few big name commercial vendors. Crude restroom facilities. - AJ9S)

Jun 11 (Sun): Wheaton, IL - Six Meter Club of Chicago. http://cyberconnect.com/orion/smcc.html. Info: Joseph Gutwein, WA9RIJ, 7109 Blackburn Avenue, Downers Grove, IL 60516-3925. Tel: 630-963-4922 or 708-442-4961 . Email: wa9rij@mc.net

Jun 24 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Jun 25 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

JULY 2000

Jul 8 (Sat): Oak Creek, WI - South Milwaukee ARC. American Legion Post 434, 9327 South Shepard Ave. Admission $5. Talk-in 146.52 MHz. Info, call (414)762-3235.

Jul 9 (Sun): Peotone, IL - Kankakee Area Radio Society, Will County Fairgrounds. I-57 to Peotone exist 327 (East). Free parking. Talk-in 146.94 MHz. http://www.w9az.com. Admission $5. Info: Don Kerouac, K9NR, 6311 East Flora St., Kankakee, IL 60901. Tel: 815-939-7548. Email: k9nr@juno.com

Jul 15 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Jul 23 (Sun): Sugar Grove, IL - Fox River Radio League. Waubonsee Community College. Admission $5. http://www.frrl.org/hamfest.html Info: Maurice Schietecatte, W9CEO, 813 Cindy Lane, Sandwich, IL 60548. Tel: 815-786-2860. Email: w9ceo@arrl.net (good, small to midsized hamfest. Easy parking. Modern restroom facilities. - AJ9S)

AUGUST 2000

Aug 12 (Sat): Quincy, IL - Western Illinois ARC. http://www.qsl.net/w9awe. Info: Jim Funk, N9JF, PO Box 3132, Quincy, IL 62305-3132. Tel: 217-336-4191 . Email: jfunk@adams.net

Aug 13 (Sun): Peotone, IL - 66th Annual Hamfesters Hamfest. Will County Fairgrounds. 45 mintues from Downtown Chicago, take I-57 to Peotone Exut 327 (East). 35 acres of free parking. 14,200 square feet of exhibits open at 8 AM. Flea market open at 6 AM to 3 PM. No additional charge for flea market space. Rain or shine -six covered pavilions for Flea Market. Tickets are $4.00 in advance with double stub, $5.00 at gate with single stub. Children under 12 free. Advance ticket sales and information: SASE and check by July 25th, Christine Mack, PO Box 2161, Oak Park, IL 60303. tel. 708-358-1786, email: christine1@mediaone.net. Talk in on 146.52 simplex and 146.64-(107.2) Stars Repeater

Aug 19 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Aug 27 (Sun): Danville, IL - Vermilion County ARA. Info: Gary Denison, KA9SKS, 14704 East 2750 North Road, Danville, IL 61834-5610. Tel: 217-759-7389 . Email: gdenison@danville.net

Aug 27 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

SEPTEMBER 2000

Sep 16 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Sep 16 & 17 (Sat & Sun): Peoria, IL - Peoria Area ARC. Info: Ron Morgan, KB9NW, or John Coker, N9FAM, both c/o: PO Box 3508, Peoria, IL 61612-3508. tel: (309)692-3378. Email kb9nw@juno.com or n9fam@juno.com. http://www.peoriasuperfest.com

Sep 23 & 24 (Sat & Sun): Grayslake, IL - Chicago FM Club Radio Expo. Lake County Fairgrounds. http://www.chicagofmclub.org. Admission $8, good both days. Info: Mike Brost, WA9FTS, 5127 North Monterey Avenue, Norridge, IL 60706. Tel: 708-457-0966, Email: mbrost@cin.net (the biggest and best hamfest in northern IL - AJ9S)

Sep 24 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College

Rd. 9:30 AM - 3 PM. Admission $6, children $2.

OCTOBER 2000

Oct 14 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Oct 22 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

NOVEMBER 2000

Nov 5 (Sun): Davenport, IA - Davenport Radio Club. Iowa National Guard Hanger, Mt. Joy Airport. Talk-in 146.88 MHz repeater. http://www.gwltd.com/hamfest

Nov 18 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Nov 18, 19 (Sat, Sun): Ft. Wayne, IN Fort Wayne Hamfest & Computer Expo. Allen County Amateur Radio Technical Society. 2000 Indiana ARRL State Convention. Allen County War Memorial Coliseum Exposition Center. Hours 9 AM - 4 PM EST Sat, 9 AM - 3 PM EST Sun. Admission $5 plus $2 parking. http://www.acarts.com

Nov 26 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

DECEMBER 2000

Dec 16 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

COMPUTER SHOW NOTES

Computer Central computer shows are held at the College of DuPage, Main Arena of the Physical Education Building Park Blvd & College Road, Glen Ellyn, Il. 847-940-7547. $5 admission with card, normal admission $6.00. Opens 9:30 am - 3:00 pm. See http://www.computercentralshows.com web site.

Giant Computer shows are held by Micro Media, Inc. Shows are usually held at the Orland Park Civic Center, 147th St. & LaGrange Rd., Orland Park, IL or at the DuPage County

Fairgrounds, County Farm & Manchester Rds., Wheaton, IL.
Admission is $6. Show hours are 9:30 AM - 3 PM. To get on
the mailing list or get more information, call (708)974-
3123. See http://www.giantcomputershow.com

Computer Country Expo is Lake County's largest computer
expo. The event is held on designated Saturdays from 9:30
AM to 3:00 PM. This show features computers, supplies,
games, parts, software, accessories, CD-ROM, monitors,
diskettes, printers, keyboards, modems, disk drives, cables,
expansion boards, services, etc. Lake County Fairgrounds,
Route 120 (Belvidere Rd.) & Route 45, in Main Exhibit Hall
Building #1=9720,000 sq. feet. For a show map, exhibitor
info, and discount coupon, visit the web site at
http://www.ccxpo.com.

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

In the 1960s and 1970s, thousands of firemen and ambulance
squad members came to rely on their crystal controlled,
transistor Plectron and Motorola desktop monitor receivers.
They have now been replaced by battery operated portable
pagers, and the desktop models are often available at
hamfests in the $5 - $25 range. Since many are in rough
condition and need repair, a hamfest special is better
suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are
excellent for dedicated monitoring of local frequencies --
a task for which you wouldn't want to tie up your 400
channel programmable scanner. They are desktop models
which can be powered from 117VAC or 12VDC with the proper
mobile cord. The audio quality of a Plectron P1, Plectron
700 series, and Motorola Alert Monitor is far better than
any consumer grade scanner and the sensitivity, image
rejection, and intermod immunity is outstanding when
aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band
receivers: VHF-low, VHF-high, or UHF. No single Plectron
or Motorola Alert monitor can cover the entire 30-50 MHz

band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the 700 and R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal

scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

The tape recorder inside the Receiver/Recorder employs two rubber belts. The Projector Recorder Belt Company makes replacement belts which work fine, though they may not be the original equipment:

1. PRB SCA8.6 (218 mm)
2. PRB SCQ 2.5 (64 mm)

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Crystals

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

The best source for crystals is:

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

You need not bother with calculating the crystal
fundamental frequency. Merely supply International with
the exact receiver model number, printed on the rear label,
and the frequency you want to monitor. They will perform
the necessary calculations.

Crystals for Plectrons

The Plectron P1 series contain two crystals. The second
local oscillator crystal is 11.155 MHz regardless of band.
On VHF high band (148 - 175 MHz), the P1 series employ this
formula for the first local oscillator crystal:

Crystal frequency (MHz)
= (station freq (MHz) + 10.7) / 4

or

Crystal frequency (MHz)
= (station freq (MHz) - 10.7) / 4

On VHF low band (25 - 54 MHz), the P1 series employ this
formula for the first local oscillator crystal:

Crystal frequency (MHz) = (station freq (MHz) + 10.7)

or

Crystal frequency (MHz) = (station freq (MHz) - 10.7)

There are two crystals (Y1, Y2) used in the Plectron R700
series, one for each local oscillator. The crystal
formulas are:

RF Range (MHz) Y1 (MHz) Y2 (MHz)
_____
25-29 (f+10.7)/3 11.155
29-32.6 (f+10.7)/3 11.155
32.5-35 (f-10.7)/2 10.245
35-41 (f-10.7)/2 11.155
41-47 (f-10.7)/2 11.155 (use 10.245 MHz
for Y2 on 44.62 MHz)
47-54 (f-10.7)/3 11.155
148-158 (f-10.7)/9 11.155
158-175 (f-10.7)/9 10.245
450-470 (f-10.7)/18 11.155

The economy Plectron 500 series use this scheme for the
first local oscillator crystal:

RF Range (MHz) Crystal (MHz)

---

25 - 35 (f+10.7)
35 - 54 (f-10.7)
148 - 174 (f-10.7)/4

Most Plectron 500s use an 11.155 MHz second local oscillator crystal. However, a 10.245 MHz crystal is used instead for receivers in these ranges: 33.4 - 33.78, 44.62, and 158.78 - 158.82 MHz.

Power Cords

AC power cords for both types of receivers use unique connectors and are scarce. I published the pinout for both Plectron and Motorola Alert Monitor receivers in June 1998 Monitoring Times magazine.

You can buy the proper replacement power cords but it's much cheaper to drill a hole on the rear panel and solder on a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

Squelch and Minimum Volume Setting

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely

silence the receiver at minimum setting of the volume control.

Tone Alert Feature

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair and Replacement Parts

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics
PO Box 212
5138 Laurel Ln.
Broad Run, VA 20137
telephone (540) 347-7760
email: weber@citizen.infi.net

Alert Monitor parts are available from Motorola. Phone (800)972-3226. The part number on the service manual for | my VHF-high band monitor is 68P81048A55-G and my VHF-low | band manual bears part number 68P81050A95-D.
Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model UHF VHF-high VHF-low

SM-301 X X X
SM-302 X X
SM-303 X X
SM-304 X X

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from
the crystals used in the conventional single channel
Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) /
10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

Plectron Alternatives

Too bad Plectron is out of business. TCS Communications
Corp. sells used Plectron receivers, in working condition,
for $75-100. If you require crystals or reeds, TCS may be
able to find some types/frequencies. Contact:

Terry Marengi
TCS Communications Corp.
tel. 1-800-TCS-XMIT
email: TERRYTCS@aol.com

If you wish to purchase a new receiver with "Plectron-like"
signaling capabilities, contact Reach Electronics:

Reach Electronics
1311 West Pacific
Lexington, NE 68850
(308) 324-6661
(800) 445-0007
FAX: (308) 324-4985

Reach sells tone & voice pagers, Alert monitors, and
ENCODERS. They also do contract manufacturing.

I currently have no Plectrons or Motorola Alert Monitors
for sale. I'm hoarding them. :-)

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 1999 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

One way to roughly estimate a radio's age is to examine the
4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most

recent date stamp.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation sells crystals, antennas, power cords, owner's manuals ($11 ea) for some older (pre-Uniden) Bearcat scanners. Electra Corporation is located at 11915 E. Washington St., Cumberland, IN 46229. Phone 317-894-3229.

I cannot furnish schematics, manuals or parts. To order a user manual for an Electra/Bearcat scanner from Uniden, call (800)235-3874 extension 2553. You can also download an electronic copy of the user manual for recent Bearcat models from the Uniden web site:

http://www.uniden.com/docs/service/support.htm

Some schematic diagrams may be obtained from Uniden's parts department, (800)297-1023. Uniden currently charges a flat rate of $54 for scanner repairs. They will repair and return "out of warranty" items without an estimate unless the repair charges exceed the flat rate charges.

The phone number for repair is (800)297-1023, too. I recommend you call repair before sending the broken scanner. Items for repair via UPS (include receipt if still under warranty) are usually sent to:

Uniden America Corp.
4700 Amon Carter Blvd.
P.O. Box 95002
Fort Worth, TX 76155

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and

2. a "feature board" containing the microprocessor controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Matt Roberds fixed a BC220 which experienced memory loss if power was removed by resoldering the positive wire to 2-AA battery holder.

As built, the BC220 logic board is grounded only through its mounting screws. In the BC220, Matt recommends adding real wire ground jumpers from the main board to the feature (logic) board to fix grounding problems.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. See March 1996 Monitoring Times magazine for BC800XLT capacitor locations and repair information.

The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

Jim Craig and Karl Klein repaired their BC210XWs by replacing the 22uF/35V C98 capacitor.

Paul Grohe replaced a failed C98 with a low ESR (equivalent series resistance), high frequency, switching regulator grade capacitor, e.g. a Panasonic HF series capacitor. He also recommends adding a 0.1 ceramic capacitor in parallel with C98.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Failure of IC9, the 9 volt NJM78M09A regulator in a BC800XLT is another cause of a blank display.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This display is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of

a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Matt Roberds repaired the Montgomery Wards version of a BC220 and contributed these insights:

"I did add some heat-sinks, but you have to be careful what you do with the TIP29 on the logic board. I added a long, flat heatsink to it and immediately created a whine in the audio. I didn't use an insulator, as this was a temporary first-try. As far as I can tell, the heatsink was radiating noise from the logic board into the front end on the radio board, which ended up being just below the heatsink. Bypassing the TIP29 (a voltage regulator) with disc ceramics didn't work; using a smaller heatsink and an insulator fixed the problem."

"There is also a 220 ohm 1/4 watt resistor on the logic board. It feeds the TIP29 from the main +16v supply. It looked a little crispy. I pulled one end and measured the current through it and it was about 30-35 mA. This works out to right at 0.2-0.25 watt dissipation. I didn't have a higher-wattage resistor, so I substituted 2 470-ohm resistors in parallel."

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Uniden/Bearcat BC200XLT Portable
Loss of Audio and Dial Lamp

If you can program frequencies into your BC200XLT but there is no audio and the green backlight no longer functions, a tiny transistor may have failed.

Check for a defective PNP surface mount transistor, Q201 (2SB815B6-YDY). Q201 is used as a switch to furnish 8 VDC to several stages of the BC200XLT. Its main purpose is to

switch off power hungry stages of the BC200XLT when the CPU thinks the NiCd voltage has fallen below a threshhold. That's an attempt to limit the current drain on weak NiCds to avoid permanent damage.

Q201 is located on the foil side of the "Micom" board, adjacent to the black multi-pin connector which mates the Micom and main boards together.

Q201 can be destroyed by a few different causes, primarily, by something in the scanner drawing too much current through it. In one case, capacitor C36 shorted. It's a 220 uF 10v electrolytic, located on the component side of the main board, connected from pin 8 of the audio IC (IC2 NJM386SL) to ground. Capacitor C55 shorted in another BC200XLT. Gary Bean reports he substituted a 2SA1298 for Q201 and it worked fine. In a pinch you bypass Q201 by soldering a short piece of bare wire between the collector and emitter, but you must first fix the component which caused Q201 to fail.

BC9000XLT: Loss of Sensitivity

John Ward has fixed two BC9000XLTs which suffered from "low sensitivity." He fixed the solder joint where the antenna jack connects to the circuit board. In both cases the tab from the board was on the opposite side of the jack from where the little blob of solder applied at the factory was located.

It was an intermittent problem that depended upon the position of the antenna cable - if the weight of the cable placed tension on the jack in one direction contact was made and the radio worked fine. If the cable placed tension on the jack in the opposite direction contact was lost and so was reception. The gap was barely noticeable.

Other Problems

Complaints of low audio output and occasional microphonics in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier activated relay inside the BC890XLT wore out. Andy found the identical relay sold at Radio Shack (part #275-232) and says the BC9000XLT uses the same relay, too.

Replacement Bulbs for BC760XLT

The Uniden BC760XLT's SCAN, MAN, PRI, and HOLD buttons are illuminated by "grain of wheat" type incandescent bulbs. Gary Saffer reports that the bulbs and buttons are located on a small printed circuit board which sits behind the radio's face plate. Gary unsoldered the burned out bulbs in his radio and replaced them with 12 volt Radio Shack bulbs (#272-1092c). They should last a long time when powered by the 8 VDC supplied by the BC760XLT.

Open Resistor in BC140

Robert Casey fixed his deaf, 16 channel Bearcat BC140 scanner. A 10 ohm resistor had opened that fed a circuit that generates 22V for the varactor diode tuner circuits. Without the 22V, there was no tuning of the local oscillator and front end, and no reception. What he did was compare voltages to a second working BC140.

Sources for Replacement NiCd Battery Packs

Replacement NiCd battery packs and inserts for the BC100XLT, BC200XLT, BC2500XLT, BC3000XLT, and other scanners are available from Uniden. I've purchased them at lower cost from:

1. Mr. NiCd - E. H. Yost and Company, 2211-D Parview Rd., Middleton, WI 53562. tel. (608)831-3443. email ehyost@midplains.net

2. Battery-Tech Central, 2818 Southland Street SW, Cedar Rapids, IA 52404-4141. tel. (800)267-3087 or (319)364-0855.

Batteries Plus has stores across they country and some have rebuilt Uniden NiCd packs for under $20.

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1999 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the RCMA Newsletter, December 1988. It may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, sci.electronics.repair, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

4. If space permits, you can replace the stock resistor with a higher value variable resistor ("trimpot") and adjust to suit.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers		
Receiver Model No.	Res-istor Value	Stock Comments
Radio Shack PRO-24	R35	33K replace with 220K. Located between pins 12 and 14

	of MC3357 (IC1)
Radio Shack PRO-2002	R197 47K try 220K.
Radio Shack PRO-2004	R148 47K remove R148
	or replace with 220K.
	On linear board,
	between pins 12 & 14
	of TK10420 (IC2)
Radio Shack PRO-2006	R152 33K try 100K or higher.
Radio Shack PRO-2022	R91 33K replace 33K
	with 220K.

REPAIR TIPS: RADIO SHACK SCANNER RADIOS

Copyright 1997 - 1999 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

Radio Shack has been selling scanners and monitor receivers
under the Realistic and Radio Shack labels for over 30
years. Most of them were manufactured by General Research
Electronics of Tokyo, though many newer models are
manufactured by Uniden.

The date of manufacture is usually printed on a gummed
label on the scanner as well as the cardboard box. A code
of 12A5, means the scanner was made in the 12th month of
1975, 1985, or 1995, for example.

There's another way to date Radio Shack scanners
manufactured by Uniden. The first digit of the long serial
number is usually the last digit of the year of
manufacture.

Another way to roughly estimate a radio's age is to examine
the 4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most
recent date stamp.

Schematics, Owner's Manuals, and Parts Available

I cannot furnish schematics, manuals or parts. Service manuals for most Radio Shack scanners sold through mid-1997 may be ordered through your local Radio Shack store.

If Radio Shack doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

Parts lists for recent and many older models are available on line at: http://support.tandy.com. Parts may be ordered through Tandy National Parts, telephone (800)241-8742, or through your local Radio Shack store. You may be able to obtain some technical assistance from Tandy by calling (800)843-7422, option 2. The RSU (Radio Shack Unlimited) phone number is (800)-433-2024.

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

GRE-Built Base Models: Dim Backlight

The backlight in many base models, including the PRO-2022, PRO-2004, and PRO-2005/6 is implemented by an electroluminescent panel, which grows dim with use.

The EL panel used in the PRO-2005 and PRO-2006 is designated EL-501, and is identified by Radio Shack part #10800050. A new EL panel can be ordered through your Tandy National parts (see above) or local Radio Shack store and sent to your home. Radio Shack no longer sells replacement EL panels for the PRO-2004, but Robert Cummings has modified an LCD from a Miller Engineering (http://www.microstru.com) experimenter's kit and fitted it to his PRO-2004. See http://dune.globe-net.net/~rc123/Robert/Backlight.html for details.

Replacing the backlight is an operation which requires care and patience. Purchase a service manual, and study the exploded parts diagrams as you read the following steps.

Top and bottom cabinet pieces must be removed, then the speaker unplugged from the main board. The front panel assembly must be removed from the chassis by removing 4 flat head screws, 2 on each side. You need not disconnect all the wiring harnesses, though you might have to unplug one so it won't get in the way of a hot soldering iron.

Unsolder the bare ground wire soldered to a large shield on the back of the front panel, located near the back of the squelch control. Two ground braids must be temporarily disconnected by removing the screws which fasten them to the chassis. After removing the volume and squelch knobs, you must remove 8 small screws which fasten the plastic front panel to the diplay board.

The old EL panel is fastened by a bead of glue and two foil type leads soldered to the display board. It's easier to cut the two leads from the old EL panel before unsoldering. A sharp knife should be used cut away the glue. The old EL panel can then be slid gently out from behind the LCD display.

The new EL panel can be installed by reversing the process, though I found that it is not necessary to glue the new panel. The two foil leads must be soldered using a minimum of heat. Reassemble the pieces in reverse order of disassembly.

GRE-Built Portables: Worn Out Keypads

The keypad on late model GRE-made Radio Shack portables, e.g., PRO-39 and PRO-43, can become unreliable after prolonged use. The best repair is to replace the rubber keypad instead of trying to restore contacts using chemicals. A replacement rubber keypad (PRO-43 keypad is RSU#10789808) may be ordered inexpensively through Tandy National Parts or your local Radio Shack Store.

PRO-43: Loss of Audio

Early PRO-43s were built with a 200 mW speaker (mfr's part #EAS-3P123A). The voice coils in some of these speakers have opened, resulting in lack of audio output, though audio is still available from the earphone jack. A more capable 500 mW speaker is available through Tandy as replacement (EAS-3P127).

PRO-43: Freezup

If you attempt to lock out all 20 channels in a memory bank, then scan only that bank, your PRO-43 will freeze up and be placed into a catatonic state. Use the procedure documented in the PRO-43 user manual to fully reset the scanner. This will "break the trance," but all the memory channels will be cleared.

PRO-2004: Dead

If your PRO-2004 is completely dead, check R235, a 1 ohm, 1 watt resistor mounted vertically on the main board.

PRO-7A: Channels 1 - 4 or 5 - 8 Dead

If the first or last 4 channels in your 8 channel PRO-7A
crystal scanner are not working and the lamps for those
channels won't light, replace IC4 or IC5 (type 7400A).

group/rec.radio.scanner.]

Abstract

This article contains product review summaries for more than
70 old and new scanner radios and monitor receivers.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. This article
describes a few of the FM receivers in my collection, and
other models I've tested. It is not meant to be complete.

You may share information with scanner collectors via the
"vintagescanners" mailing list at:

http://www.onelist.com/group/vintagescanners

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass,
Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass,
Monitoring Times, May 1995.

I have published full length reviews and modifications of
these scanner models in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT
Mar 1987 - Radio Shack PRO-2004
Oct 1990 - Radio Shack PRO-2006
Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037
Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable
Oct 1995 - AOR AR-2700 Portable
Nov 1995 - selected AOR AR-8000 measurements

Mar 1998 - RELM MS-200 mobile
Apr 1998 - RCA RP-6150 portable
May 1998 - Radio Shack PRO-2050 base Trunktracker
Jun 1998 - Opto DC442 CTCSS/DCS/DTMF display
Jul 1998 - Stub and Par Electronics intermod rejection filters

Aug 1998 - Sony SC1PC portable
Sep 1998 - Orange Book of Scanner Repair
Tone Out Testing (2-tone generators)
Monitoring ACSB (amplitude compandored side band)
Oct 1998 - AOR AR8200 portable
Nov 1998 - Alinco DJ-X10T portable
Dec 1998 - Radio Shack PRO-91 portable Trunktracker
Jan 1999 - AOR AR7000
Feb 1999 - Radio Shack PRO-2066 mobile Trunktracker
Mar 1999 - ICOM RS-8500 software for controlling the IC-R8500
Apr 1999 - ICOM IC-R2 portable scanner
Jun 1999 - Mini-Circuits ZFSC-4-1 4-way passive splitter
Jul 1999 - Racing Electronics RE2000 portable
Aug 1999 - AOR AR16 portable
Sep 1999 - Uniden Bearcat BC245XLT portable
Oct 1999 - Plectron R700 series monitor receivers
Nov 1999 - Uniden Bearcat BC278CLT clock radio scanner
Dec 1999 - Uniden Bearcat BC248CLT clock radio scanner
Jan 2000 - Radio Shack PRO-92 portable scanner
Jan 2000 - Stridsberg Engineering FLT201A FM Notch Filter and
MCA-204 Receiver Multicoupler
Feb 2000 - Yaesu VR-500 portable wide coverage receiver
Mar 2000 - Uniden Sportcat SC-200 portable scanner
Apr 2000 - Understanding Intermod,
(comparison intermod performance of several models)

Note: Reprints of Monitoring Times articles are available for $3.00 each plus a self-addressed stamped envelope from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this reprint fee.

ALINCO

DJ-X10T: 1998 vintage. Rugged construction - metal back. Multimode frequency coverage 0.1 to 2000 MHz (minus cellular bands). 20 selectable step sizes from 0.05 to 500 kHz. Knob atop the radio clicks when rotated and serves as a VFO knob, channel selector, and menu navigation control. Several battery pack options for NiCd and alkaline battery cases. Furnished with an EBP-37N 4.8 V, 700 mAH NiCd pack and a sturdy 11 hour drop in charging stand. Loaded with firmware features and complicated to use. Two VFOs and 1200 channels in 30 banks of 40 channels each. Memory banks are cryptically designated, though you can scan combinations of banks. Each memory channel can be programmed with the frequency, an 8 character label, attenuator, a skip (lockout) flag, and mode (WFM, NFM, AM, USB, LSB, CW, AUTO). Very slow 6 ch/sec scan rate. Rescan delay is about 1 second and cannot be disabled or changed. Auto Memory Write stores up to 40 frequencies but does not check for dupes.

20 linkable search banks with labels. Up to 50 frequencies per search bank can be locked out. Digital clock with on/off timer. Battery saver can be disabled. Ability to scan or search for signals above a selectable threshold or channels with a specific mode. Band scope 7 or 40 steps wide. In short, 30 - 1000 MHz sensitivity is good, few birdies and little intermod. WFM broadcast reception very good. The DJ-X10T squelch can be set to one of 10 levels. We had to keep the squelch set to SQ3 or higher, otherwise it opens at inappropriate times, especially when the battery saver is active. The DJ-X10T instruction manual does not specify the IF (intermediate frequency) scheme. Filters inside the DJ-X10T imply 0.455, 10.7, and 45 MHz IFs. Our tests indicate a first IF of 736.25 or 275.45 MHz, depending on the frequency to which the DJ-X10T is tuned. Our DJ-X10T hears images of cellular phone signals clearly in the 1419.9 - 1444.9 MHz range, 550.9 MHz above their actual frequency. For a full review, including technical test results, see Monitoring Times, November 1998.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

AR5000: 1996 vintage. approx. 30 kHz - 2600 MHz coverage super receiver. Good sensitivity throughout. AM, SSB, CW, FM detectors. Frequency readout to 1 Hz. More features than any other radio. DTMF reader and RS-232 interface included. Multiple settings for IF and AF selectivity, attenuator, AGC, deemphasis, etc. DB9 RS232C connector. Negatives include low contrast LCD display and difficult user interface. NFM squelch closes slowly, causing noise burst at end of each NFM transmission. Electromechanical relays click at various frequency boundaries, including 400 MHz, producing a clickety-clack noise -- annoying while scanning banks of mixed band frequencies. Great radio, otherwise. See "AOR's AR5000 All-in-One Receiver," by Bob Parnass, in Monitoring Times, December 1996, for a review which includes quantitative test results.

AR8200: 1998 vintage. S/N 550004 tested. Portable, high end "super" scanner covers 0.1 - 2040 MHz (minus cellular in USA version). Not a scanner for beginners. Many of the settings are made through the use of menus. Lots of features. 4 AA batteries, steel belt clip, plug-in AM antenna. 1,000 conventional channels in 20 banks, 10 temporary channels, one priority channel. Each memory channel may be programmed with frequency, label, mode, step, step-adjust, offset, attenuator enable, noise limiter, AFC, and write protect. Multi bank scanning. You can enable a 0 - 9 second rescan delay with each scan group, but not per channel. 40 pairs of search limits with labels. Offset capability for monitoring repeater input frequency. LCD display easy to read. Display and keypad backlit using green LEDs. The band scope. Shortwave reception stone deaf on shortwave when fitted with the supplied antenna or a 19" whip. Seriously overloaded on shortwave by a 132 foot long dipole unless we use the built-in attenuator. Supplied "dorsal fin" antenna for AM BCB. Scans slowly (14 channels/s). Requires more current. Audio quality is slightly above other portable scanners. Computer port. One slot for a single plug-in option: voice inversion descrambler, CTCSS search, 256 frequency tone eliminator, voice recorder and playback, or extended (slow) memory. See AOR AR8200 review by Bob Parnass,in Monitoring Times, October 1998, for review with quantitative test results.

ICOM

IC-R10: late 1996 vintage (serial number 01048 tested). Shirt pocket size multimode is powered by 4 AA penlight cells. Covers 0.5 to 1300 MHz (minus cellular). NFM, WFM, USB, LSB, AM, and CW detectors included. IF bandwidths are fixed. No 30 kHz bandwidth for satellite or FM military monitoring. Battery saver circuit, with selectable duty cycle. Single VFO and 1000 memory channels. There are 900 memory channels divided into 18 banks of 50 channels each. Another bank of 100 channels used to hold unique frequencies found during an auto store operation. 20 pairs of search limits. Up to 100 frequencies may be locked out during a search and stored in a final bank of 100 channels which is cleared before subsequent auto store searches. Each channel can be programmed with the detector mode (e.g., AM, USB), a tuning step size, an attenuator enable flag, and an 8 character label. CI-V computer interface requires extra cost hardware. 7 segment S-meter. Noise blanker. Good sensitivity. Lighted keypad and display, but keystroke sequences are cumbersome.

Good radio hardware in a handy sized package, but scanning performance unimpressive. Very slow memory scanning at only 6 channels/second. Searches at about 16 steps/second, with

little or no worthwhile improvement using the "Signal Navigator" feature in the R10 I tested. Rescan delay cannot be disabled. Can only scan one memory bank or all banks, not a combination of banks. No squelch for SSB or CW modes. See "ICOM IC-R10 Receiver," by Bob Parnass, in Monitoring Times, March 1997, for review which includes quantitative test results.

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the ICOM user with a very annoying clickety-clack, clickety-clack! For Baseband Audio out, I mounted an RCA jack on the back of the R7100A and connected it via shielded cable to the junction of resistors R228 and R230 on the Main Unit. This point is located in the vicinity of IC15 and X3 on the

schematic.

R8500: 1996 vintage. 100 kHz - 2000 MHz coverage. 20 banks of 40 channels although bank sizes can be changed. 100 Auto store and 100 Skip memories but that can be increased by reallocating channels from the conventional scan banks. Fixed and programmable step sizes. Relays clickey-clack while scanning across band boundaries. Triple conversion, First IF is 48.8, 778.7, or 266.7 MHz, depending on band. Second and third IFs are 10.7 and 0.455 MHz. Weak to moderate cellular images starting near 1106 MHz. Rugged construction. External power supply. DB25 RS232C connector. Audio peak filter. Ok scanning and great searching performance. See "ICOM R8500 Receiver," by Bob Parnass, in Monitoring Times, January 1997, for a review which includes quantitative test results.

UNIDEN/BEARCAT AND ELECTRA/BEARCAT

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel

interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout. See US patents 4,092,594, granted 5/30/78 and 4,114,103, granted 9/12/78 for further insight.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. See US patent 4,270,217, granted May 26, 1981. LED readout. Good scanner, but tinny audio.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1996.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC230XLT (Uniden): See BC220XLT.

BC235XLT TrunkTracker(Uniden): 1997 vintage. Portable with 300 channels in 10 banks. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. A query feature identifies duplicate memory channels. Very fast scan and search rates. Scans 64 channels/sec and skips empty channels. Service search. Data skip. Triple conversion, 254.4, 10.85, 0.45 MHz IFs. Excellent image rejection and intermod immunity. Fairly good audio. See "The Uniden Bearcat BC235XLT," by Bob Parnass, AJ9S, in Monitoring Times, July 1997 or an on-line version at http://www.grove-ent.com for a review which includes quantitative test results.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen,

police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels See US patent 4,270,217, granted May 26, 1981. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite. See US patent 4,409,688, granted 11/11/83 for further insight.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC895XLT TrunkTracker(Uniden): 1997 vintage. Base with 300 channels in 10 banks. Covers military air band, but other frequency coverage is limited compared with the BC9000XLT. Predetermined AM and NFM modes not selectable. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. Weather alert siren. Built-in CTCSS decoder and tone finder. A query feature identifies duplicate memory channels. Test unit scans 85 channels/sec and skips empty channels. Triple conversion, 380.8 or 254.4, 10.85, and 0.45 MHz IFs. 800 MHz images in commercial and military air bands attenuated over 35 dB. For technical test results and a review, see "The Uniden Bearcat BC895XLT," by Bob Parnass, AJ9S, in Monitoring Times, December 1997.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob.

Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. For a full review, see "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times. See US patents 4,947,456, granted 8/7/90, 5,163,161, granted 11/10/92 and 5,212,817, granted 5/18/93 for further insights into fast scanning and searching implementation.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. NiCd pack provides about 5 hours between charges. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

REGENCY

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging

capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. See US patent 4,057,760, granted 11/8/77. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Z60: base/mobile sporting 60 channels, but 10 of them are for FM broadcast only. Built in alarm clock, priority, and memory which requires no battery backup. Covers 30 - 50, 88 -108, 118-136, 144-174, 440-512 MHz. Notice that it's not spec'd to cover some important federal bands: 136 - 144 and 406 - 440.

RCA

RP-6150: 1997 vintage. No frills, good performing portable. 200 channels in 10 banks. No military aircraft frequency coverage. Triple conversion and a flexible battery arrangement. Lacks duplicate channel detection, search skip, and empty channel lockout features of newer designs. Our sample isn't super sensitive at 470 - 512 MHz and has some intermod around the VHF railroad channels but is generally more resistant to image problems than the BC230XLT. For technical test results and a review, see "The RCA RP-6150 Portable," by Bob Parnass, AJ9S, in Monitoring

Times, April 1998.

RELM

HS200: 1996 vintage. Very good 200 channel portable. 10 banks. Built-in CTCSS and DCS decoder. Lighted keypad. Duplicate channel detection. 100 frequencies can be locked out from search. Very good audio and strong front end. Excellent internal shielding. Global rescan delay. Covers CB. Fixed modes and step sizes. IFs are 280.2 and 0.45 MHz, and perhaps one in between. See "The RELM HS-200 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1997, for a review which includes quantitative test results.

MS200: 1998 vintage. Made in USA. 200 channel mobile with alpha labels. CTCSS and DCS decoding squelch. Programmable via PC using supplied software. Low contrast, LCD display. Keypad backlit for night programming. Rear panel tape audio jack. Test unit had lots of intermod on VHF-high band. IFs are 280 and 0.45 MHz. See "The RELM MS-200 Scanner," by Bob Parnass, AJ9S, in Monitoring Times, March 1998, for a review which includes quantitative test results.

RADIO SHACK

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

PRO-26: 1995 vintage. (Not to be confused with a simple 1985 crystal controlled portable bearing the same model number.) Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn

on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range. IF frequencies are specified at 608.005 - 611.2 MHz, 48.5 MHz, and 455 kHz.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-62: 1994 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO-64: 1997 vintage. Good portable 400 channel scanner using up conversion. Replaces PRO-62 and has many more features. Selectable AM/NFM modes but fixed step sizes. 10 search banks which can be cascaded. Auto store saves unique frequencies found during a search. Frequencies can be loaded using a computer but optional interface kit not yet available. Can recharge Radio Shack's optional, monolithic NiCd pack, but not AA cells within the scanner. IFs are 257.5, 21.4, and 0.455 MHz. See "The Radio Shack PRO-64," by Bob Parnass, AJ9S, in Monitoring Times, August 1997, for a review which includes quantitative test results.

PRO-67: 1997 vintage. Good portable 200 channel scanner using up conversion. Replaces PRO-51 and has better image rejection and super fast scanning. Service Search lacks police frequencies. Fixed AM/NFM modes and step sizes. Can lock out up to 20 frequencies during a search. Can recharge AA cells within the scanner. Frequencies adjacent to the cellular phone bands censored so our PRO-67 will not receive 868.9625 or 823.9625 MHz. Intermediate Frequencies are 254.4, 10.85, and 0.45 MHz. See "The Radio Shack PRO-67," by Bob Parnass, AJ9S, in Monitoring Times, October 1997, for a review which includes quantitative test results.

PRO-91: 1998 vintage. Portable made by Uniden for Radio Shack. 150 channels in 5 banks. Can selectively follow conversations in 800 MHz Motorola trunked radio systems. Censors 823.975 - 823.95 and 894.0125 - 896.1 MHz covered by the BC235XLT. Powered by four individual AA alkaline or NiCd batteries. Power save feature. Program key. One priority channel/bank. One search bank. Direct search. Service search omits many police freqs (inc. 460 - 460.5 MHz). While connected to an outdoor antenna, our PRO-91 experiences intermodulation interference in the 161 MHz range from a paging transmitter on 158.1 MHz. IFs near 380.7, 10.85 and 0.450 MHz. See PRO-91 review by Bob Parnass, in Monitoring Times, December 1998, for review with quantitative test results.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft.

Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Somewhat prone to intermod in the 460 MHz range. Cellular images throughout the 847.6 - 869 MHz range. See September 1996 Monitoring Times for modifications.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 -

612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-2045: 1996 vintage. Very good 200 channel base/mobile made for Radio Shack by Uniden. Tuning/channel selector knob. 10 banks, selectable attenuator, and rescan delay. CTCSS-capable with optional board. Great Auto Store. Weather alert. Scans and searches fast. Can lock out 50 frequencies during search. Step sizes fixed but AM and NFM modes are selectable. IFs are 380.7, 10.7, and 0.455 MHz. Images on VHF-high band despite high 1st IF. Some intermod on review unit. See "The Radio Shack PRO-2045," by Bob Parnass, AJ9S, in Monitoring Times, February 1997, for a review which includes quantitative test results.

PRO-2046: 1996 vintage 100 channel mobile made by Uniden with fairly good performance. Descendent of the BC760XLT but no CTCSS option available. Ten banks of ten channels. Scans memory at about 34 channels/sec. Service search, direct search, and band search. Preset search limits by band and user cannot program the search limits. Image rejection is minimal, as one would expect from a scanner with IFs of 10.85 and 0.450 MHz. 10 Monitor memory channels. Can lock out up to 20 channels from a search. See "The Radio Shack PRO-2046," by Bob Parnass, AJ9S, in Monitoring Times, October 1996, for a review which includes quantitative test results.

PRO-2050: 1998 vintage 300 channel Motorola trunk system tracking base made by Uniden. Tight front end. Excellent performance. Chassis-less, plastic construction. Squelch and volume knobs too close and Manual key is hard to find. IFs are 380.7 (approx.), 10.85, and 0.45 MHz. AM and NFM modes are factory set and not selectable. 300 channels in 10 banks and a 2 second rescan delay may be programmed on a per channel basis. Query feature identifies duplicate memory channels. Our PRO-2050 scans at 78 channels/sec., skipping over empty channels. 10 priority channels. Up to 50 frequencies may be locked out from limit search. A single pair of limits may be programmed for a limit search. No Direct key or direct search facility. Factory preprogrammed frequencies for police, fire/emergency, commercial air, public service, and weather, but not marine. See May 1998 Monitoring Times for a review which includes quantitative test results.

SONY

SC1PC: 1998 vintage. Good RF and audio performance. Covers 25 - 1300 MHz, minus cellular phone. Selectable step size

and mode. Computer control and downloading with software and PC cable provided. Powered by ordinary AA batteries. Provided CDROM includes both the scanner control program and the multi million record PerCon FCC license database. 10 banks ("pages" in SONY parlance) of 30 channels each. Per-channel 2 second rescan delay. Unlike the ICOM IC-R10, you can scan any combination of memory banks. You can lock out ("skip") memory channels from scanning. The frequency stored in a skipped channel will also be skipped during searches. One priority channel checked every 5 seconds. SONY's limit search is restricted to one pair of search limits, though computer control expands this to 20 linkable pairs. Band search lets you search through 17 bands programmed at the factory. Service search. A cache, termed Intelligent Memory, stores the last 10 unique frequencies that were active for longer than 5 seconds each. IFs (in MHz) are 600 (below 370 MHz), 232.5 (above 370 MHz), 45.0, and 0.455. See "The SONY SC1PC," by Bob Parnass, AJ9S, in Monitoring Times, August 1998, for a review which includes quantitative test results.

SPORTYS

JD-100: 1997 vintage. Limited 20 channel scanner which covers civil and military air bands only. Good audio. Large display shows frequency only out to 2 digits. Slow scanning and odd keystroke sequences. No key press confirmation beep. Cannot lock out channels from memory scan. Powered by AA batteries. Battery saver circuit. See "Sportys JD-100 Air Scan," by Bob Parnass, AJ9S, in Monitoring Times, November 1997.

CRAIG (division of PIONEER)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

SONAR

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X			no
FR105	6	X			no
FR2512	24	X			no
FR2513	24	X			no
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2516	10	X		yes	yes
FR2517	10	X		yes	yes
FR2525	10	X		yes	yes
FR2526	10	X	X	yes	yes
FR2527	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

TENNELEC

Manufactured the first synthesized scanners. See US patents 3,961,261 and 3,962,644, granted 6/1/76 and 6/8/76 respectively. Company went out of business several years

ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes and extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

How to Obtain Copies of Patents

Printed copies of US patents may be purchased for $3 each, but you must know the patent number. Credit card orders are taken over the telephone by the Assistant Commissioner for Patents at (703)305-4350. Alternatively, you can mail a check or money order, made payable to "The Assistant Commissioner for Patents" to

The Assistant Commissioner for Patents
Washington, DC 20231

For more information about the US Patent and Trademark Office, call their automated information message system toll-free at (800)786-9199.

There are various patent servers on the world wide web, including IBM's server:

>
> Any help would be appreciated,
> Thanks.

Use Length (in inches)=2808/F where F= Freq in MHz
However, it is very possible that the telescoping whip does indeed contain a coil and if so its inductive reactance at VHF and up is probably enough for it to act as a choke and isolate the portion of the antenna above the coil. So the above formula is valid for a whip w/o any type of load.
This yields the length for a quarter wave antenna (the shortest resonant antenna) and assumes a ground plane at the base- which is minimal w/ a handheld. Note that extending to 2X this length will make it a half wave, but the end impedance of a halfwave is VERY high and not appropriate for the low input Z of the handhelds RF stage.

I bought mine in the hopes of using it at work.....
I work in the basement of an auto plant with 10 acres of floor space.
We have lots of welding machines, including 2 types of electron beam
welders. One welds at 65 KV, the other at 260! The room I work in
has a metal ceiling - drip pans, actually - to catch any oil from the
various machines that drips through the 12" of concrete above it.
Great enviroment for listening to a scanner, eh?.....

The Sony works GREAT!!! It's a bit staticy, but sound quality is very
good. Pulls in all the local police & fire, both dispatchers & cars.
Even get the narcs, with their small ht units. I couldn't be happier.

Thanks for reading my post.

1) PRO 2021 200 channel base/mobile scanner, with mounting bracket/hardware, screw in antenna, and manual, NO box. Has attached AC cord, and will include DC (lighter plug) cord. Display light works fine. No mods done - works and looks good.
Asking $80, OBO.

2) AEA-FAX software version 2.6, (both 5.25" & 3.5" disks) and cable, with users manual, in original video tape cassette box. 16 gray level or false color. Can be
daisy chained with PK-232 or PK-88 to share the same com port. Also, it has on screen tuning display, and can run unattended and store images to hard disk.

Asking $25, OBO.

If you have any questions, please e-mail me.

The model number is the same. It's still the 245XLT.
The difference is that there is only a one second delay, intead of the
5 second delay before the radio checks another trunk system or scans
conventional banks.
Scanners Unlimited has a few in stock.

I'm real happy with my Icom W32A dual band 2m/70cm w/air band and weather. It has dual receivers. Listen to V/V, U/U, V/U, U/V, or V/air, U/air or V/Wx or U/Wx. Both sides of each of the preceding combinations can be monitored simultaneously. Good reports on transmit, also.

Dave, KD8DLW

Hello,

While scanning the Commonwealth of Mass (Metro Boston) Trunk today I found a new talkgroup testing for the upcoming Marathon monday.

The talkgroup is 34992 and consisted of "Marathon Control" testing with the various fire departments along the route (Natick, Framingham, Boston). Also the Fire Marshall was on the talkgroup.

At the end there was message that the group was secured until 1100 Hours Monday.

I have observed that my whip is excellent for monitoring lower frequencies. I listen to 43-47 MHz a lot in addition to the 150's and the 450s. I often lock on a frequency and compare the whip to the duckie and notice hug differences to the extent that the duckie doesn't even pick up stuff the whip can. I havbe been using a cheap $9.99 Radio Shack whip on a 6 foot' car window extension cord. Mind you the cord itself will help too!

I just wanted to digress upon the gnome project of Miguel de Icaza and Sasha Levien, and the parallels to the Genome Project of Celera and the tax funded Human Genome project. Man!!! Computers are getting into the very corpuscles of our human makeup!!! I don't know if it's fascinating or terrifying.

It is as controversial, however, as the disagreements over the nature of ionized particles and matter, ... the diametrically opposed viewpoints of the Superstring exponents and those fuddy duddies who still clutch at Einstein's Quantum Mechanics like an aluminum teddy bear.

Here are my ideas on DEUTERIUM, HELIUM and Fluoro-photons ---

[PHOSPHATES, PHOTONS, Dark Matter and Fluoropatite]

Of the nearly 200 phosphate minerals, only one, fluoro-patite, is commercially important. Isn't that odd??? Only one!!!

The wet-acid process, when the phosphate rock is treated with sulfuric acid, creates a VERY IMPURE phosphoric acid.

Phosporic acid is then treated with SODA ASH (NA2CO3) to make PYROPHOSPHATES in very large amounts. I mean very very very large amounts.

Halogen atoms, especially chlorine and bromine, restructure the pyrophosphate oxygen bonds very limitlessly, creating INFINITE wall-to-wall molecular structures that are highly VISCOUS (like resins) and quite elastic.

PHOTONS, not necessarily dissimilar to the above, do not adhere to the outdated "fuzzy ball" picture of photon behaviour anymore, and lack a foundation in logic, and cannot be in any way or time proven QED!!

It (fuzzy balls; are fuzzy balls the same thing as fuzzy cotton lint balls? Most people have forgotten about the powerful explosive called gun-cotton that even explodes in water that the British Navy was using at the turn of the century --- cotton is the only plant that has a long fiber composed of one single elongated cell). Fuzzy Balls are not a physical law, and everybody knows this now.

Thus, the "photon" is an "informal" unit of energy.

Fourier analysis is most frequently used to backup the fuzzy ball status quo, or I'm starting to get fuzzy myself!

see website

http://www.delphi.com/tattler

for more on Fourier technologies

Hence, there is still TO THIS DAY no theory to adequately explain the "anomalous magnetic moment" of the electron.

DEUTERIUM & HELIUM ---are odd balls when defining Quantum Mechanics VERSUS superstring theory, especially in regards to DARK MATTER.

Alternative candidates for Dark Matter are either primordial black holes or some UNDISCOVERED STABLE PLASMA expected from theories of supersymmetry and Grand Unified Superstring Physics.

see

http://www.geocities.com/RainForest/Canopy/5322/index2.html

and all linked and related websites associated with it, for more details.

>have a pro-90 and pro-91) .
>Eric G.

If a radio system is all digital then it is possible to use the same system
for MDT's, otherwise the MDT's will be on another frequency. Many of the new
MDT's are using different protocols then the earlier ones and no software is
available to decode them. It is also illegal to intercept MDT's because
of federal wiretap laws. So if you do it you are taking a risk and better burn
anything you receive.

Source record: 90188

thank you for your info. I wondered why nobody else had posted any MDT answer's. I just figured I must be the only one interested in my area.

I'm probably wrong, but it sounds like Keith Knipschild got in trouble because he posted the MDT info on the net, confidential info. Bill and Cindy Cheek got in trouble because they sold the equipment to monitor MDT'S on the net. if someone told me how to install and monitor MDT'S, is that illegal?. if I kept the info from the MDT to myself, is it still illegal? I only ask this because I honestly don't know. right now I only monitor trunked systems.

any and all info appreciated.

The save mode will work ONLY when monitoring one channel on hold.
This doesn't work in scan or search modes.
While the radio is stopped on one channel, the radio 'sleeps' then
checks that channel for activity every few seconds.
This option will give the batteries a longer life.

Go buy a cell-phone magmount antenna with the 10 foot cable. Place it on top of the roof in the middle, run the cable down back between the bed and the cab and if you can't find a hole under the cab drill one about 2 inches in from a corner, run the cable through it and under the carpet up to where you want to mount the scanner. Get one of those cellphone holders that are adjustable and mount it where you want the scanner to be along with the end of the cable. Go back to the hole and do this in the evening, so it sits all night undisturbed, fill the hole with the cable with black RTV silicone sealant/adhesive. Now for all intents and purposes it looks like you have a cellphone installed and not a scanner or something funky....sure the gain might be a little weak on the lower freqs but then the action on the trunked channels is right where this antenna works best....enjoy....

Fred

992. Re: how to test battery mah rating?

Newsgroup: rec.radio.scanner

You connect the battery to a resistor, then monitor the voltage across
the resistor untils it reaches its lowest practical operating voltage
for that load. From the voltage measurements you calculate the
current. While you can calculate the area under the resulting curve
its easier to just take an average. Multiply this by the time in
hours and this gives you the amp-hour capacity.

You need to familiarize yourself with Ohm's law. Have fun.

993. Ameritech Frequencies

Newsgroup: rec.radio.scanner
Date: 2000-04-16 00:00:00 UTC
From: Patrick <PatrickFwd@Yahoo.com>
Message-ID: <NP9K4.2805$%L6.162806@monger.newsread.com>
Source record: 90059

Hi, I'm pretty new to the scanning scene, I just got my first radio about a month ago. I've been looking around for the radio frequencies that the Ameritech telephone company uses for its communications, but I am stumped on where to look next. I've tried a number of databases, but they either gave me no info, or limited out of date stuff. If someone has any ideas, or links to good databases, could you please post them? Thanks for your help!

Patrick

================================================================================
900 MHZ BAND FREQUENCIES

Many of today's 900 MHz cordless telephones offer digital encryption
or spread spectrum technology. Either of these systems will render
the reception of the conversation by an ordinary scanner impossible.

886.9625 931.9625 886.9875 931.9875

But most of the 900 MHz channels may be digital and/or encrypted, so
you couldn't hear them anyway.

Heck, might as well stick my 2watts in:
<shrug> so you're giving up your VE badge--guess what? I'm going to
get mine, and yes, I got an extra under the (omigosh) *new* rules.
Heaven forbid we *ever* change anything--why, we could still be using
horses to get around!

The new rules? Don't really care one way or the other--might just
have taken a few months longer to get my Extra, yet ppl with that
attitude, seem to want to scorn me as "not really an Extra"--wait
until I fire 30wpm CW at you by the end of the summer. Sure, and
some of you could fire it back too :) But I bet some "real" Extras
might not :)

And I've gotten one person already licensed (KC HLL), and am working
with two others, and they will have a license by midsummer with luck.
I'm going to go to the school here at some point and time, and try
to get a club going there, as hams in Grinnell, IA are few (3 active,
for the most part, 2 PT). I'm going to try and get involved with the
weather net in Johnson IA. Isn't this what being a "real" amateur is
about? Furthing the hobby? Generating good will with the public?
Putting forth that "Extra" effort? Why hold so much animosity?
Before you turn your license in, why don't you listen for me on 10m?
See waht kind of op I am?

Want to know what the value of my license is to me? It took me 10
years, before I got licensed--CW held me back for years, and then the
internet distracted me (and a couple hundred thousand others who
might have gone into the hobby). But I perservered, and passed my 5
wpm--and immeadiately started working on 23 & 30 wpm.

Would there have been another ham, had I not gotten a license, to
call on a repeater for an ambulance and a tow truck for the couple
who had an accident on I-35 when I was travelling to Kansas City a
few weeks ago? No one else was stopping to help, even though the
mini-van was in a ditch, and obviously damaged beyond repair. <sigh>
The new rules, are the rules, whether we like them or not--adapting
to them is what requires character, not a fast code speed.

I recently recieved one of these in non-working condition. It
appears the chip for the display board/PLL is burned out, and I've
been told these chips are no longer available. ANyone have any
suggestions on how to resurect this fine old radio?

Also, I have an old (maybe 1968-1975) Motorola FM VHF-Hi HT. ANyone
have any info on these? I've got it transmitting agian, but no
modulation. I want to eventually convert it to work on 2m, so the
next person that I help get a license has something to use until they
can purchase their own. It has four channels, so 146.52, and 3
repeaters ought to be a good start for local work.

REMINDER!: 133 survey's returned so far! Excellent!

I have created a Radio Scanner Survey Project web page for receiver owners to vote on what they think about the radios they own. Stop by to register your thoughts and once their has been enough feedback, I will posts the results on the same link as below. Thanks. We need your input to get this to work! GO TO THE WEBSITE TO PARTICIPATE. I think this will be a valuable and interesting survey for us scanner enthusiasts.
SURVEY HERE: http://people.mn.mediaone.net/slyster7/survey.htm

Thanks!

MIND CONTROL UTILIZING DIRECTED-ENERGY WEAPONS
--NEW WEB SITES

Get the unvarnished truth about mind control involving directed-energy weapons and usage in the Cleveland, Ohio, area of the United States (and elsewhere)--so far apparently censored by Internet search engines, so that I have to do my own publicizing. Even the Internet seems to involve a certain amount of censorship. Criminals who want to control the social structure unhindered by any legal restraints would rather relegate this report to an obscure corner of the Internet. They have been operating avowedly totally amoral for several decades now. Hardened criminals flaunt their amorality mockingly in front of victims, knowing police will not respond to complaints. They operate at close range with no serious police interference. The cost of secrecy is high in human suffering. The criminals being sought do nothing but manufacture radiation weapons for the torture and destruction of humanity. As far as they are concerned, these weapons are for them primarily brain damage, torture, and extortion weapons for use in combat situations and wars of conquest--as instruments of social control in disregard of any Bill of Rights. Positive applications are lost. The objects of this "combat" are currently innocent, unarmed American civilians in their homes, and preparations could be underway to subject victims the world over to further atrocities.

YOU HAVE THE RIGHT TO KNOW !!!!

What you don't know could literally kill you or leave you vulnerable to total enslavement.

I didn't know until I was struck that there was absolutely no privacy in my supposedly private home. Thugs enter at will and spy on all citizens' activities with no restraint, often out of pure voyeurism. Not to mention activities which frequently go way beyond mere observation--into the realms of physical torture and psychological terrorism. I personally have been a victim of indefinite stalking (circa 30 years!) combined with all of the preceding. The length of this stalking gives some indication of the zeal with which perpetrators are intent on destroying human

rights and achieving domination of the human race. The muffling of information provides an absence of any resistance--an advantageous situation for amoral gangsters. This information is a two-edged sword, in a damned if you do and a damned if you don't situation brought to a crisis by horrible levels of abuse of technology.

So-called nonlethal weapons are actually lethal when used indefinitely without restraint and under certain conditions. Most victims harbor some amount of brain damage, deliberately inflicted by literal cooking of their craniums with hazardous radiation by thugs. This is a primary method relied upon to seal in the secret, ensuring the triumph of totalitarian control and organized crime.

Criminals don't want you to know for one overriding reason. They fear regulation. With total ignorance of the population they need not fear detection, limitation, or reprisal. They would not be as inhumanly vicious as they are if safety were their primary concern. It is a misguided belief that the purpose of national security is served by suppression of information, which results in no legal or practical regulation or preparedness for assault. Help stop them and their Attila-the-Hun-type tactics of Control.

For more information see my web site at any of the following web addresses (mirror sites). CyberCities and Crosswinds addresses have no banners or ads:

http://www3.cybercities.com/c/capaliwoda/mindcontrol

http://www.crosswinds.net/~capaliwoda/mc

http://www.geocities.com/capaliwoda/mc

http://www.angelfire.com/electronic/mindcontrol

dealing with my particular instance of victimization and whatever I have been able to find out. I have recently started these web sites, which are still in progress. They are undergoing continual overhaul, but basic information is in place.

I have a 895XLT that I've now had for a couple years. Unfortunately, the backlight doesn't work on it anymore. It went out last year. Everything else still works fine with it, but no backlight. I have to have good lighting in order to see what frequency I'm stopped on. Usually, I can tell what it is by what is being said, but it makes it a pain to add new channels or lock-out channels that become annoying. Has anyone ever attempted to replace the back light and how difficult is it?

Did you try hitting the light button? You may have turned the light
off.

1017. What is ICALL?

I was trying to find info on the new Uniden BC780XLT and when it lists trunking capabilities, it lists

Motorola Type I 800Mhz
Motorola Type II VHF, UHF, 800, 900
EDACS 800, 900
LTR
ICALL

I know very little about LTR and haven't heard of ICALL. Who uses ICALL and what are it's advantages that would make companies use it over the others already in business? Also, isn't EDACS sometimes used in UHF? If so, why wouldn't they make the scanner to work in UHF?

>BC-800XLT base scanner.
>
>--
>RaggedyMan

If you're talking about setting the search limits on your BC 800 XLT, here's how you do it:

1) Select a frequency range to search, like 152-156 MHz.

2) To search 152-156 MHz, enter "152.000" with the number keys, then press the "limit" key. Next, enter "156.000" using the number keys, then press the "limit" key again.

3) Now press "search." The BC 800 XLT will search 152-156 MHz until it finds an active frequency. The procedure for setting search limits is the same for all frequency bands. If you want to stop the search at any time, press the "hold" key. To resume the search, just press the "search" key again.

Regards,
David

Jamie,
Try here:

http://www.perconcorp.com/

I've found it very usefull.
You will have to click onto a few pages to get to the search engine on
the site but once there you can look up frequencies for almost everything
in your area.

Brendan; regarding the BC-300, are you sure it's a burned out chip and not the switching power supply? There is a 22ufd/16Volt cpacitor designated C98 on the rf circuit board. It is near a small switching transformer (much smaller than the power transformer) and the capacitor is in series with the primary of the transformer. I had mine fail and I replaced it with a 47uf/35volt cap and it works fine now. Hope this helps. 73's Bob

It looks like they explicitly want to make it illegal for anyone to divulge what they hear on a public safety radio channel. Does anyone know who is responsible for this section on HR3489? It does not seem to have anything at all do with cellular phones.

There is more to this story. When the Federal Appeals Court judge found for Larry Gass in Oklahoma, mention was made of 18 USC 2511. The judge used this section of the US Code to conclude that it was perfectly legal for ANYONE to divulge ANYTHING that they heard on a public safety radio channel (as long as it wasn't encrypted/scrambled/whatever).

If you find the file on my website titled WHAT EVERY SCANNIST NEEDS TO KNOW ABOUT GASS, BILL CHEEK, AND THE LAW - you can find the links to the 2 decisions by the Judge (which are pretty easy to read). Please excuse the confused nature of my file - it is pretty tough to figure out all the aspects of this legal stuff.

1045. PRO-2040 - Operation and Reception Questions

Newsgroup: rec.radio.scanner
Date: 2000-04-17 00:00:00 UTC
From: Richard Smith <rsmith@planeteer.com>
Message-ID: <_TGK4.27033$Xk2.105769@tor-nn1.netcom.ca>
Source record: 89964
Cross-posted to: alt.radio.scanner,rec.radio.scanner

Hello there,

I picked up a PRO-2040 from my local Radio Shack on the weekend on sale for approx. $100US (I live up in Canada). My previous radio was a PRO-2034. I have a few questions on the new radio:

(1) When scanning, I seem to find more frequencies than before, but many of them do not seem to have anything audible on them. Are these birdies (if so there are lots!), or are they channels that I could just not hear before because my older scanner was less sensitive ? It may be that I am not listening to them long enough to hear anything, I just wait a few seconds and then continue with my limit search.

(2) Is there any way to turn off the key 'beep' ?

(3) Can anybody recommend a better set back antenna to replace the standard screw-in telescopic whip ? I would prefer not to have a base station antenna at this time.

Thanks,

Richard.

Upon closer inspection, someone had replaced that one already with a
47uF *16V*--I made the mod you suggested. I noticed there are
several parts that look to have been been way overheated (browned),
and after p;lugging it in, I noticed that the 5 VDC Regulator (by
C100), had gotten quite warm after power on for only 30 seconds.
There are about 20 browned parts in that area. Ever heard of this
particular problem?

Message-ID: <ORLK4.11593$fF5.399599@news1.rdc1.il.home.com>
Source record: 89977

Dan

I have had a 2052 for about 3months now and I have come to the
conclusion
that the scanners only 2 faults that I can see is 1. It doesnt have quite
the sensitivity it should probably have. I use it for trunk service only and
in my county there are 3 towers around the county the 2052 got 2 out of the
3 well
but the 3rd one sometimes was scratchy and faded sounding. I solved that by
putting up an el cheapo RS scanner ant for 19.95 and put it up about 20 ft
off the ground, solved that problem, now all towers are heard well. #2. it
wont scan trunked and conventional at the same time. If you live in an area
where there are lots of public safety freqs. that are not trunked maybe the
2052 is not for you. Around here everything (except Hiway Patrol) is on
trunked service,
and I mean everything,, the standard VHF freqs. are virtually dead since
they
switched. So for me a scanner that will only scan conventional OR trunked is
not a big deal. Around here the trunk system is Edacs which not all base
type scanners cover. From 3 months experience these are the only complaints
I have, and now since I put up the antenna I really dont have any complaints
about it.

Jeff

I use the same RS whip for my ICOM R2 wideband receiver. Works great, and one of the only ways to
pick up broadcast AM radio and SW with portability. The center coil is real, and you can tell by
"touching" the antenna on various bands, and seeing which frequencies are desensitized as you touch various
places of the antenna.

1065. Pozilla Software Closed Due To Illness

Newsgroup: rec.radio.scanner
Date: 2000-04-17 00:00:00 UTC
From: John LeMay <jlemay@nospam.njmc.com>
Message-ID: <8dgd2b$8n2$1@news.monmouth.com>
Source record: 89984

Just saw this on StrongSignals.net, thought some would be interested.

<copiedtext>

News & Noteworthy
April 16/17,
2000
I just received the following from Melissa Goldman,
wife of Adam Goldman, President of Pozilla
Software:

Adam wanted me to send you an e-mail. He was
hospitalized last Monday with a collapsed
lung and the office has been temporarily
closed. While the doctors have released him
from the hospital, he has been ordered to bed
rest for a couple of weeks. In the interim,
the office is closed. If you could release a
statement that the office is closed and why
it is closed, that would be very appreciated.
Please let people know that e-mail will be
answered at least once a day until his health
improves. I am doing the best I can to keep
things running like now, but since I do not
have the extensive knowledge of scanners and
the software that my husband has, I am very
limited on what I can reply to. Please assure
everyone that Pozilla is still around and we
will do our best to facilitate our customers.

I'm sure I speak for all of us in the scanner
community when I offer our heartfelt wishes for a
fast recovery, Adam! Take care of yourself and
we'll be here, waiting patiently, when the time
comes for you to climb back in the saddle!

Since I am going to replace the EL panel on my 2005, I was considering applying the "audio improvement" mod at the same time. After making up a parts list, I realized that I didn't know if I should be purchasing electrolytic caps or ceramic disc caps. Could anyone provide some insight here?

Also, if anyone has any feedback on how well this common mod worked, please let me know!

1069. How did glue get on the circuit board??

Newsgroup: rec.radio.scanner
Date: 2000-04-17 00:00:00 UTC
From: Nick Bergthold <nbergthold@yahoo.com>
Message-ID: <sfnr316g7l5131@corp.supernews.com>

Well, I was cracking open the case to my PRO-2001 and PRO-2020, a total investment on about $3.00 each for me (I'm a garage sale phreak), when I noticed that on part of the main board on my 2001, there was glue! A big puddle of hard, off-white glue! It looks kinda like wood glue. But why is it there? I was even more surprised to see that when I open my 2020, it also had glue on the circuit board! An even bigger puddle this time! Now, I know these scanners are used, but why would they BOTH have glue on them? Has anyone ever scene this before? Got any answers, or possibilities? Also, I'm desperatly looking for any mods for both of these scanners. I can't find any, and me being the non-electrian type, I have no idea how to adapt any other scanner mods to these models. A little help please? Thanks in advance. If you want, I can send you a digital pic of the glue on the circuit board. Just let me know. Thanks again!

I once tried to modify a piece of equiptment (not saying what) and was suprised to find the very chip I needed access to was entirely covered in over an inch of epoxy glue, making modification impossible. What they did at the factory was exactly this:

They took one of those plastic individual serving jelly cups like the kind you find at Dennys for your toast and filled it full of epoxy. Then turned it upside down over said IC chip, and let it cure, thus encasing the chip entirely. I tried to carve away the epoxy with a dremel tool, but it was futile. Rained on my parade!

Perhaps a similar function is performed by the glue on your board?

In article <sfnr316g7l5131@corp.supernews.com>, nbergthold@yahoo.com says...

The interface is a 5-pin PCB header (.025" square pins on 0.1" centers).
The mating socket is standard (RadioShack.com's Cat# 910-1471 is 25 cents,
plus 24 cents for 3 contacts), but a segment cut out of a DIP socket will
work just as well. The pinout is symmetric, with pins 1&5 (the outer ones)
carrying data in (to the radio), 2&4 are data out (from the radio), and
pin 3 is ground.

The cable connections are:

BC895 DB9 DB25
1 <= to radio 3 2
2 from radio => 2 3
3 <= ground => 5 7
(TR-CD-DSR) 4-1-6 20-8-6 *
(RTS-CTS) 7-8 4-5 *

* If you will be using a standard communication program, add the two sets
of jumpers in the RS-232 connector to simulate the normal control signals.

The comm protcol is half-duplex, 9600 baud, 8/N/1. Commands to the radio
should be terminated with a C/R only.

Black Cat Systems (http://www.blackcatsystems.com) has released version 3.2.1 of MultiMode, a program for amateur radio operators and radio hobbyists that allows the transmission and reception of morse code, slow scan TV, and other modes.

The latest version of MultiMode fixes a small bug that could cause a short pause when the mouse button is clicked.

MultiMode is shareware, and may be downloaded from the following URL: http://www.blackcatsystems.com/software/multimode.html

MultiMode is a shareware application which allows your Macintosh to decode and transmit several different modes of non-voice communication often heard on shortwave and ham radio. It is the only program of its kind for the Macintosh,rivaling commercial packages for the PC platform costing hundreds of dollars. It is ideal for amateur radio operators, shortwave radio listeners, and other radio enthusiasts. MultiMode is localized for for Dutch, French, German, Italian, and Spanish, in addition to English.

MultiMode allows you to decode and display morse code, RTTY, FAX, SSTV, ACARS, and many other modes on your Mac, without any extra hardware. MultiMode now also allows you to transmit in most of the modes of operation.

In the past, dedicated hardware, often costing hundreds or thousands of dollars, was necessary to demodulate and decode this transmissions. Today, you can use the processing power of your Macintosh to decode and display these modes, without any hardware. Just connect your radio's speaker output to your Mac's microphone input, and you're ready to go.

MultiMode supports the following modes:

Morse Code (CW)
RTTY (Baudot)
ASCII
SITOR-A
SITOR-B / FEC / NAVTEX
SSTV (Slow Scan TV)
WEATHER / SATELLITE FAX
ACARS (Aircraft Communications)
PSK31
ALE (Automatic Link Establishment)
DTMF, CCIR, EIA Tone Modes
Hellschreiber
Audio Spectrum Display / FFT Mode

Black Cat Systems creates and distributes Macintosh software, with a specific emphasis on programs for the scientific, amateur radio, and health markets.

Information about Black Cat Systems entire line of products can be found at http://www.blackcatsystems.com

manufacturer does not have a problem with grabbing a new board, as the marginal cost on them is probably $10 and labor costs for some guy screwing around with one would be more than that, plus could have cold joints or problems later.

The antenna that came with it is very good, you can go to a ground plane or discone and hang it from the ceiling or put it on top of bookcase, etc., around your desk. These antennas are only about 2 feet tall, don't take up much room. Anything that just sticks up out of the radio will perform about like the stock antenna.

1st Universe is Southern Californiaï¿½s best option when it comes to high-speed Internet access. We are unique in that we use dedicated, secure and robust radio spread spectrum technology to bring distributed Internet services directly to our customers.

Our signal works on what we call spread spectrum hopping technology, which has been in use by the United States military for the past 20 years. This offers the added security and reliability that will help take our customers into the next dimension of high- speed Internet connectivity.

Wireless is an emerging technology and it is the true future for providing competitive, no hassle connectivity to the Internet.

Wireless Client Rooftop Setup:

Non-Penetrating Roof Mount is considered a Temporary Installation. FCC approved Wireless Radio/Modem using License free 2.4 GHz ISM (Industrial- Scientific-Medical) band fully complies with IEEE 802.11 standard.

1095. EDAC trunk following question on PRO-92

Newsgroup: rec.radio.scanner
Date: 2000-04-18 00:00:00 UTC
From: Peter Parsons <pparsons@asic-design.com>
Message-ID: <38FD2919.49B4779D@asic-design.com>
Source record: 89915

I am fairly new to scanning, and have set up a
RS pro-92 for EDAC trunk scanning for Lakewood, Colo.

It 'works' sometimes, but other times it appears the move
the control channel. Is this a common practice? for the RS PRO-92
On the pro-92 I must have only 1 EDACs system per bank, and the control

channel must be in channel 1 (with all other freqs. sequential from
there). So if they move the control channel around on a daily (or??)
basis
I either must reprogram, or dedicate several banks for the permutations
of
the particular EDAC system - or am I missing something about how to
program/track this system.

Thanks in advance for any hints.

Richard,
Glad to hear you're enjoying the PRO-2040. One of the things I dislike about this scanner is that it does have a lot of birdies. However, the PRO-2040's data skip feature is very useful for dealing with the birdie problem. When enabled during the search mode, the data skip will allow the PRO-2040 to resume searching after 2-3 seconds if an unmodulated carrier, paging signal, etc. is detected.
A good way to tell if your PRO-2040 is receiving a birdie is to disconnect the scanner's antenna. If the signal is still present when the antenna is disconnected, then your scanner is receiving a birdie.
A good back of the set antenna is Radio Shack catalog #20-161. The antenna extends to 40 inches and will receive signals from 30-512 MHz, according to the RS catalog. Actually, the 20-161 RS scanner antenna will receive signals beyond 512 MHz: I use this antenna for receiving 800 MHz signals with my Uniden BC 800 XLT scanner, and it works quite well in that frequency range. Since the 20-161 antenna has a Motorola plug, you'll need a

Motorola to BNC adapter to use this antenna with your PRO-2040.

73,
David

1108. Re: PRO-2005/6 Audio Improvement mods

Newsgroup: rec.radio.scanner
Date: 2000-04-18 00:00:00 UTC
From: James Carter <jcarter64@home.com>
Message-ID: <38FBE01E.B6204CBF@home.com>
Source record: 89999

Just did this one to my 2005 on the weekend and a 2006 a couple of weeks ago. You need
1-1000uf 16v elec.
1-.1uf 50v mylar or ceramic disc
2-.47uf 50v Mylar of ceramic disc
2-4.7uf 50v Elec.
1-1uf 50v elec.
The voltages can be those specified or above. When you take the linear board off, you have about 10 screws all the way around and one hidden inside a metal rf shielding box in the middle(from the front of the radio it is the one on the right of the two smaller boxes). Unsolder the battery connections (make sure you have your channels written down somewhere because as soon as you unsolder the battery they are all gone). Unsolder the two ac power supply leads and remove the front panel with about 5 wire connectors on top and a couple underneath and two grounding wires(where you are going to replace the EL display). Look from the front of now faceless scanner and you will see that as you start to lift the board from the top that there is a white connector with 4 pins in it in the center connecting the upper board to the lower board, remember this when you are reasseblying the board so you don't wreck this connector. The mod it self isn't all that hard if you have lots of soldering experience. With my big hands it was hard to solder on to 2 pins of an IC to replace a capacitor. Once you are done that ,you might as well change R152 from a 33k ohm to a 100k ohm to help the squelch be more accurate. You will have to cut the trace under the IC between pins to remove the little 33k resistor from the circuit and solder on 100k onto the top of the IC. All in all it took about 2 hours from the time I started till I finished. I went slow and didn't want to have to trouble shoot after it was done. The audio mod made a big difference to me, it added allot of bass to the voices and sounded much better. The squelch mod made the adjustment of the squelch knob (pot) much tighter and it took some time to get used to the new settings. Before, mine was set on 5 and to get the squelch to break I would have to turn cw to about 6.5 or 7. Now when it is on 4 I can hardly make it 4.5 before it breaks, much better. If you need any further help just email. james

No problem with the glue--that is what the manufacturers and the government decided to use to stop smart people from changing the parts and making the scanners pickup private conversations like cell phones--they also make it hard to get a service manual so you have a hard time discovering the mods--and it is working, no one has been smart enough to crack any scanner manufactured since 1994! Guess we got no smart electrical engineer folks in our group!

Considering that you're doing a self-selected survey of a niche group, I think the response that you have so far is outstanding. I'd suggest putting up some preliminary analysis while the survey is still running so that future participants can see that you are really doing something with the information.

Sometimes, scanner front end components are covered with wax to prevent
what are known as "microphonics." You can find wax used in older
Electra/Bearcat scanners, Regency scanners, old CB radios, etc.

Microphonic components change their electrical characteristics
when touched, moved, or subjected to vibration.

You can tap a microphonic part with a pencil eraser and actually
hear the effects come through the audio stages and out the radio
speaker.

I had a cheap Heathkit RF signal generator which was prone to
microphonics.
I could put my face near the front panel and shout. The mechanical
vibrations of my voice on the front panel and components actually
modulated
the output signal!

Bring the battery to a hobby shop. The 4 cell Scout pack is identical
to a typical 4 cell r/c airplane receiver pack that sells for about
$14. This is usually a stocked item for hobby shops. You can then
simply solder the new pack in. Opto wants $40 + shipping.

Just a quick question on Birdies. Do all scanners of the same type and model, have the same number of birdies ? Or, due to manufacturing tolerances, do some scanners have more than others of the same type/model ? If there is a fault in a scanner, could it show up as extra birdies even though the rest of the scanner operation is perfectly normal ?

Thanks,

Richard.

1128. Wacars - Loads of raw data - very few decodes

Newsgroup: rec.radio.scanner
Date: 2000-04-18 00:00:00 UTC

Cross-posted to: rec.radio.scanner,alt.radio.scanner,alt.radio.scanner.uk

Hi group

I have recently been trying to use Wacars 0.7 with my PCR1000 - My problems is this:- I leave everything running overnight, when I get up in the morning I have loads of raw data, and, if I am lucky, one or two decoded messages.

Set up is as follows:-
Wideband vertical on the roof attached PCR1000 connected to SBPCI128 line in, using TalkPCR 2.4 for tuning and Wacars 0.7. Radio is tuned to the Primary European frequency on AM

I have about 3-4 red blocks with squelch wide open showing on the signal bar in Wacars, so I am guessing its not signal related (I have the switch inside the PCR1000 set to "phones" rather than "speaker" (as suggested in the PCR1000 manual)

Has anyone any suggestions as to what might be causing this anomaly?

Slammer

1129. Uniden AC Adapter Model AD-140U Voltage info needed

Newsgroup: rec.radio.scanner
Date: 2000-04-18 00:00:00 UTC
From: Mike Gormley <WA8VEC@ARRL.net>
Message-ID: <38FC7DE5.F0D5241F@ARRL.net>
Source record: 90020

Would some on please measure the output voltage on the above adapter and tell me what you get. Mine reads 17 VDC, but it is a pretty cheap meter I am using, too. The name plate says it should be 12 VDC. Is this within tolerance or should I get a new one?

The adapter is being used with the BC200XLT scanner. Also what should the output voltage be for the battery pack? The battery pack gets very hot and does not hold a charge. Maybe I only need to replace the battery pack, but not the adapter. But if the pack went bad from the charger, I hate to ruin another battery pack.

My scanner has gone completely dead.

This is a common problem on the Bearcat 200s. You have one or more bad cells in your battery pack. Do NOT operate the radio this way, since the heat causes both a fire hazard and possible damage to the radio.

Either replace the nicad pack or open up the battery holder and disconnect the leads at the battery terminals. This will allow you to run the radio "direct" off of external power, thus eliminating the heat issue and resulting dangers.

Yes. The Sportcat is an easy-to-use scanner for a beginner. The older Sportcat 150 is a good choice, the newer Sportcat 180 is even better.

Don't pay full price for a new one, though. These are quite plentiful on eBay and at local pawn shops.

HELP!
I just bought one, and I have yet to snag a signal beyond ONE FOOT. I have much testing yet to do, so my complaint may be unfair at this point. I still have a week to return it.

Has anyone else had luck with this unit?

Below is a verbatim email from Opto support, saying the unit is normal:

David,
The antenna that comes with the Micro Counter is centered around 440MHz. So, it is not going to be too good for the low band signals like CB's.

As for the cordless phone at 900MHz, no counter does a great job of picking up cordless phones. Our $700 Xplorer needs to be within 10 feet. The reason is that cordless phones transmit about 10 milliwatts of signal. The instability of the signal on 900 MHz is normal.

The Micro Counter does work without the antenna, but as you noted you have to be right on top of it. That's normal. Again that works like any other counter or nearfield receiver. Without an antenna on those products you have to be right on top to pump the signal directly into the front end. Using the antenna on any of those is paramount.

We don't have a little adapter as you mentioned, although others have made them and claim it makes a huge difference as it gives them the ability to use different antennas with bnc connectors and not just the one that came with the unit. Antennas make all the difference in the world on any unit, whether it is the Micro Counter or the Xplorer.

Sincerely,

Kevin Cox

Dave,

You need a better antenna. Counters are not generally very sensitive; if they are, they pick up all kinds of crud and then you need a digital filter to make the display read sense. Try one of the 15 inch flexible antennas -- you'll need an adapter, sure enough -- and see if performance doesn't improve. FWIW, sensitivity below the antenna resonant frequency will drop by half each time the frequency is reduced by half. This means, at 220, your sensitivity is half; at 110, it's 1/4, at 55 it's 1/8 and at 27 MHz it's 1/16. Due to the antenna alone!

Regards,

Cortland

I have always had very poor results with WACARS. I think it has to do with attempting realtime serial decoding under Windows. The results are going to be poor unless you have a VERY fast processor (my 233 MHz Pentium-MMX is too slow) and lots of memory.

KRACARS is much more accurate, but it only runs in DOS and only gives out raw decodes with no interpretation.

Slammer

This is my setup: These settings are for a Loft
Discone/YupiMVT7100/Soudblaster AWE64 setup:

Wacars Settings:
Use 44.1KB Sampler (this might be your problem)
Error Checking: Only Header

Souncard Mixer settings:
Master Vol. 3 (so the sound bursts are not too loud thru your speakers)
Line In vol. 5 (Checked for Playthru and Record)

Scanner Vol.6/7 {past half way).

Initially scanning unsquelched you should get 1-3 measures on the sig
strength scale (in WACARS) for background noise. If not adjust your vol to
this. I find it works best. It seems you can't overload the signal easily.

The databases that come with WACARS are not brilliant a better set can be
found at: http://home.kabelfoon.nl/~pdw/alp/ Also check the FAQs on this
site.

Once you start getting messages unsquelched turn the squelch just on so that
you scan the two freqs.

If you are getting raw data check to see if it looks like this:

<SYN><SYN><SOH>
C.N610FF<NAK>
Q09<STX>
M20AFF9088<ETX>

The bit in brackets are critical the <SYN><SYN><SOH> is the start of the
message and the message is in the text <STX> =Start text <ETX> = End text
etc. I don' know what <NAK> means. The message should decode as this:

----------20:23:22, 12/03/2000
N610FF B747-282B 20501/178 CKDF
BRADLEY FIRST AIR FF9088
Using Ground Station C Amsterdam .Message No. M20A
Message Type Q0 LINK TEST

This is the simplest type of message to check the link.

Don't be afraid to 'pump up da volume'. It is difficult to overload the
signal.

Spikey Mikey

WACARS 7, PCR1000, P100 PC, SB16 sound card.. No problems at all..
Audio level on an empty channel with squelch open, about 1/4 way up the
scale..

I have found that the frequency for my local McDonalds uses 154.49Mhz for it's "Drive-Through" ordering system. Does anybody know of any other common frequencies used by other companies ? Also, how do you hear the customer side of the conversation ? I searched around the 150 to 160 mhz range and could not find it.

I must admit, it can make for some quite humourous listening !!

Thanks,

Richard.

How does ne go about finding such frequencies? Do you sit in the parking lot w/ the scanner searching that freq range? Or do you know an employee of the establishment? I've seen some fast food freqs on the net, but haven't tried 'em... and don't even know if they'd be accurate for my local area (Austin, TX).

I found a frequency on the net for a drive through for a restaurant in a nearby town, and found that it worked. I went to the local McDonalds for lunch, and sat in the car eating while being entertained by the service staff.

Well, the FCC database is a good start.

There's also lots of 'scanner' pages on the web with this info.

But with the advent of handheld frequency counters, as on sale
at Radio Shack for as low as I thing $80, find them yourself.

1145. BC245XLT - Need Help .. Please!

Newsgroup: rec.radio.scanner
Date: 2000-04-18 00:00:00 UTC
From: Mark Fitzgerald <markf@campnet.nb.ca>
Message-ID: <qi3L4.13299$oQ4.276025@sodalite.nbnet.nb.ca>
Source record: 90036

Hello all,

I've been trying to get my bc245xlt to work via its interface to my computer.

I've downloaded many programs to try but now will work.

I've tried using com-1 through com-4 and I've checked all connections. Sometimes the programs seem to act like they are working, but nothing (commands) gets to the scanner. A few of the programs, freeze and I have to alt-ctrl-del to get to the task-man and if they are shown as - Not responding .. I end task. (kill it.)

Other programs: If I select scan and a program says scanning, it is not really scanning.

I programed in 12 of the most used frequencies for my area and told various programs to scan. It never got to the scanner, because my base scanner with the an inside antenna was scanning the same 12 frequencies and stopped many times on active freqs.

I tried my other computer which also runs win98. I uninstalled the modem on it. I then copied scanner programs over to it. I hooked up the interface to com-2 and tried again. Still the same problem .. Nothing getting to the scanner. I have checked all connections and I've followed the manual for hooking it up.

I can not download or upload frequencies or nothing else.

Any help with this problem would be greatly appreciated !!

Thank you for taking the time to read this.

Mark

(I forgot to add), however, I could only hear half of the conversation. I could not locate the driver side of the transmission (from the talking sign), and for the neighboring Wendy's and Burger King I could not find anything at all. The McDonalds transmission went quite far actually, almost a block, so I should have been able to find the others assuming they have similar output power.

Richard.

Open your squelch so that there is a constant signal going to your sound card (just to test). Sometimes that split nanosecond it takes to break the squelch will cause you to lose the data. I use error correction with Wacars and it either copies it 100% or nothing. I don't like seeing half garbled messages.

Did you press the button on the bottom right with what looks like a
key. It then shows up on the LCD on the scanner. This puts it into
remote, which now the scanner program will work.

I have found that the Micro Counter is worthless without the optional
antenna, so I never use mine without it.

I have snagged VHF HI and UHF hand helds from 10 to 50 feet away, cordless
phones, that's another story; needs to be very close, like a few inches at
most.

50 feet would be pretty good. I need to experiment somemore.

I'm having a problem that my Micro Counter switches modes by itself, and sometimes goes blank. I have it in "C" mode for snagging, and it flips to "A" after about 5 minutes. Does yours do that?

Alkaline battery is run down to 1.3 volts (unloaded) after about 3 hours. Seems fast....

1154. FS/trade: TenTec Scout HF rig

Newsgroup: rec.radio.scanner

Just back from TenTec with fresh tuneup and noise blanker installed.

80-10 meter modules

Matching 937 power supply-looks like the radio

matching 231 antenna coupler-works real good-loads up a wet noodle!

manual and mike

40 and 80 meter Hamstick mobile antennas

$600 or will take less without antennas

What do you have for trade?

[One or more binary attachments are retained only in the source text.]

1155. FS/trade: Bearcat BC-101

This one is in real nice shape and has the original manual.

It was the FIRST user programmable scanner that used the scan buttons as dipswitches to program using codes from the manual.

16 blinking lights are great to watch and you can lockout any channel using the switches.

It was the first scanner to do away with crystals.

Very collectable.

$150 or take a good regular scanner in trade or trade in as this one should be just sitting in a collectors shelf.

Evereything works fine on it with no problems or burned out lights, loose switches or any other problem.

[One or more binary attachments are retained only in the source text.]

Thanks for the information. Could you suggest a reasonably priced/compact groundplane/discone antenna that I could look at on the web.

Thanks,

Richard.

If you use a scanner like the PRO-92, which has PL and DPL tone detect and display, you can see the PL tone switch back and forth when the customer talks, then the clerk, etc.

How about a Law banning the use of phones WHILE driving!!!
Where in the Hell do you come off making laws that scanner listeners
should bow down to?

THe ones who use cell phones while driving need to be eavesdropped or
have their company ban them from the highways and stick them in a
cubicle at work and not have any cell phones at all!

WHO in THE Hell Invented the Damn "Cell-phone"?
Cell phones during sex! Think about it! WHY?
Cell phones during weddings/funerals/ graduation ceremonies/ bar
mitzvahs?
Come on AMERICA!! GIVE THE PHONES A BREAK!!
Everywhere you go you see a phone "glued" to someone's lame ass head!!

Leave the scanner communities ALONE!!!
Take your communist approach towards AMERICANS and GOTO HELL!!!

Thanks for the info. I am concerned that the circuit board in the battery pack might be "fried". I looked inside the pack and there is some scorching on the components. I have no problem buying just to batteries and installing them, but there is a possibility I may have to buy the entire battery pack anyway.

Are there any voltage checks I can do, to make that decision?

Mike

I've had it working on a P133 with 32M.

Code30 decodes it on P75, every bit of data. Unfortunately it doesn't
have the databases WACARS has.

>them ?

There are epoxy solvents. Nasty stuff apparently.

The real problem is: if it dissolves the blob of epoxy that covers the
CPU, it will also dissolve the epoxy package around the CPU chip, any
plastic transistors, and epoxy-coated resistors and capacitors. It
will also dissolve the epoxy-fibreglass circuit board itself.

Epoxy solvents are a good way to find out what's inside something,
if you want to reverse-engineer it and copy part of the design for
a new circuit that you are building out of new parts.
It is *not* a good way to obtain a working radio that can be modified;
the solvent will generally ruin the circuit it's used on.

Dave

If it were me, I'd probably get the power supply and go back with it
in hand. At that point I'd make sure you can power up the radio and
enter and listen to one of your local frequencies. Your best bet
would probably be NOAA since it's a continuous broadcast.

If all goes well there I'd say you've got yourself a deal.

HAPPY SCANNING!!

Weather Radios with Specific Area Message Encoder capabilities do exist. The
National Weather Service can warn specific counties of specific (but
pre-defined) weather events.
SAME technology is very similar to the EAS message system the NAB uses.
Radio Shack has a nice weather radio with the SAME system.

Well by eavesdropping with my scanner I have found out that my sixteen year old neighbor boy was arrested for burglary and is smoking pot. Also by listening to my scanner I was able to help my local police department catch two people who were involved in an assault near my home. I heard the description of the persons involved in the assault on the scanner and was able to tell the police where they were because they walked right in front of my house! So don't don't give me all this B.S. about listening to private conversations. Next you'll be telling me that I shouldn't listen to the storm spotters or the national weather service because I might be warned about the tornado that is coming for my house! I agree leave the scanner listeners alone and worry about things in this country that need real attention.

How about a Law banning the use of phones WHILE driving!!!
Where in the Hell do you come off making laws that scanner listeners
should bow down to?

THe ones who use cell phones while driving need to be eavesdropped or
have their company ban them from the highways and stick them in a
cubicle at work and not have any cell phones at all!

WHO in THE Hell Invented the Damn "Cell-phone"?
Cell phones during sex! Think about it! WHY?
Cell phones during weddings/funerals/ graduation ceremonies/ bar
mitzvahs?
Come on AMERICA!! GIVE THE PHONES A BREAK!!
Everywhere you go you see a phone "glued" to someone's lame ass head!!

Im a american and fuck you you forighner.

Leave the scanner communities ALONE!!!
Take your communist approach towards AMERICANS and GOTO HELL!!!

Hello everyone,

I just bought a Pro-26 for 150 dollars. I'm just wondering if any of the 26's are *not* modifiable.

There is a second 26 for sale at the same place I found (pawn shop in Seattle). I'm thinking about purchasing it and selling it. Anyone know what the common going price is for a 26?

I probably could purchase both 26's and get the price lowered a bit...

Thank you for any replies. Please email me if you post a response as I have little time to be at home to check usenet for responses.

Thanks!

I forgot to add: since there are two units for sale,
is there a preference for various dates/model numbers?
I noticed on the back that there is some numbers that
I recall say the date and there is also a long number
but I don't know what it stands for.

Message-ID: <20000418234613.06884.00000186@ng-fg1.aol.com>
Source record: 89927

Just program all of the channels in the proper order. The order may not be what you think it is. If you leave the scanner in the open mode, it will receive ALL talk groups assigned. If in the closed mode, only the talk groups you have stored, and not locked out will be heard. DO NOT lock out the control channel as stated in the owners manual.

Hi Richard,

I just realized that you're in Canada. The frequency pairs for Fast Food Restaurant Drive-Throughs are slightly differnt up there. Their Speaker frequency is most likely on 30.580.

==========

These are the most common Fast Food frequency pairs for Canada:

Canada Headset/Speaker frequency pairing for VHF-low / VHF-high band:

Speaker Headset Region

30.020 - 154.600 NWTerr
30.400 - 154.540 Pacific, NWTerr
30.480 - 154.570 NWTerr
30.480 - 168.090 Quebec
30.540 - 154.570 Ontario
30.580 - 154.490 NWTerr, Ontario, Quebec, Atlantic
30.840 - 151.670 Pacific, NWTerr, Ontario, Atlantic
30.840 - 154.570 Pacific, Ontario, Quebec, Atlantic
31.240 - 151.670 Atlantic
31.240 - 151.895 Ontario, Atlantic
31.575 - 151.895 NWTerr
32.480 - 155.310 Pacific
32.480 - 154.510 NWTerr
32.480 - 154.570 Pacific, NWTerr
33.140 - 154.145 Pacific
33.160 - 154.510 NWTerr
33.160 - 154.515 Pacific
33.140 - 151.670 Ontario
33.400 - 154.540 Pacific, NWTerr, Ontario, Quebec, Atlantic
33.880 - 151.835 Ontario
33.840 = 154.540 Pacific
35.020 - 154.600 Pacific, NWTerr, Ontario, Atlantic
35.120 - 151.655 Ontario, Atlantic
35.880 - 151.835 Pacific, NWTerr, Ontario
35.960 - 151.805 Pacific

Canada Headset/Speaker frequency pairing for UHF band:

Speaker Headset Region

457.5250 - 467.7500 Ontario
457.5500 - 467.7625 * Ontario

457.5500 - 467.7750 NWTerr, Ontario
457.5750 - 467.8000 NWTerr, Ontario
457.5750 - 467.9750 Ontario
463.4375 - 468.4375 Ontario
464.6250 - 469.6250 Ontario
464.9625 - 469.9625 Ontario

==========

These are the most common Fast Food frequency pairs for the USA:

USA Headset/Speaker frequency pairing for VHF-low / VHF-high band:

Speaker Headset

30.840 - 154.570
31.000 - 170.305
31.240 - 151.745
31.325 - 151.865 *
31.400 - 154.515 *
33.140 - 151.895
33.140 - 170.305 *
33.160 - 154.515
33.400 - 154.540
33.400 - 154.570 *
35.020 - 154.490 *
35.020 - 151.895 *
35.020 - 154.600
35.120 - 151.775
35.880 - 151.835
35.960 - 151.805

USA Headset/Speaker frequency pairing for VHF-high band:

Speaker Headset

151.715 - 169.445
151.775 - 171.905
154.570 - 170.245
154.600 - 171.105
154.600 - 170.245 *

USA Headset/Speaker frequency pairing for UHF band:

Speaker Headset

457.5125 - 467.7375
457.5250 - 467.7500
457.5375 - 467.7625
457.5500 - 467.7750

Here's also an interesting note: The system is usually a cross band repeater(hams should be familiar with this).

The repeater listens on VHF Hi usually (although there are plenty of UHF systems now), and uses *2* CTCSS tones. One tone activates the drive thru speaker, the other does not. This allows for the order taker to press, say, button 1, and talk to the cutomer (while still repeating it out on say, 35.02). If the order taker, or anyone else wearing a headset hits Button 2, it does *not* activate the speaker at the customer end, and acts as as intercom. (For instance, for the "runner" to ask the order taker if it was a chocolate or vanilla shake). Hopes this helps a little.

It's worth keeping in mind that, the main feature of the above unit is it's size. and it's appearance....it's easy to get very close to the source due to the above.
So range is not as much of an issue as it appears to be at first glance. I can tell you, that a friend picked up one of these units a while back(BTW, they sent him a defective unit...he had to exchange it)...he has been quite happy with it, and has solved several local "mysteries" with it.

You should see the one they just put in by my house! (
http://www.qsl.net/k0ees)
Ground everything--well. Also, if most of your stuff is 12 V,
consider running it of of a lawn mower battery($20 at wal-Mart), and
a 1.5 amp trickle charger ($12 at Wal Mart). I run the following off
of such a setup: 2m HT, 10m rig, scanner, SW radio, and a QRP 80m
rig, and a amp for the 2m HT. Even with all items running, it
doesn't put a dent in the battery's current output (capable of
putting out at least 80 amps for 10-15 seconds--check to see what
power supplies cost that can put out even 25 amps). If you need
other voltages (9 or 6), you can get three terminal voltage
regulators for about $1.99 at radio shack that are super easy to hook
up (three terminals--Vin Ground, and Vout), and supply up to 1amp
each. If you needed 2 amps at 6 volts, just parallell 3 of them
(give yourself 1 amp headroom).

Source record: 89936

Mike,
My AD-140U measures out at 18.43volts using a Fluke multimeter. Understand, these "wall warts" are unregulated and require the specified load (in this case 500ma) to bring the output voltage down to specified. The control circuitry is in the battery pack. In all likelyhood, one or more of your nicads in the pack are bad. You can buy a new unit from many sources, Radio Shack, W & W Associates, The Nicad Lady, etc, check your ham magazines and catalogs for battery vendors. You can also buy just the batteries and install them in your present battery case, it's easy. It contains 6 AA nicads at 1.2volts each for a total of 7.2volts. The circuitry in the pack filters and regulates the 12volts (roughly) supplied by the wall wart. DO NOT attempt to hook 12volts direct to the contacts on the bottom of the scanner where it mates with the battery pack. Doing so will FRY the scanner and you will have an unusual paperweight.
W & W Associates www.wwassociates.com lists a complete battery pack, 7.2v @ 800mah, for $39.00, p/n WC-092-BCS. Check around, you may be able to beat this price. I bought a nimh battery insert from another company (whose name eludes me right now) 7.2v @ 1200mah (50% more capacity, but 50% longer charging time) for about $20 and installed it in my battery case. Works great. Check eBay, that's where I found it.

Thanks for all the suggestions guys and gals

It would appear I have all the correct settings, anyway it magically started working when I woke this morning, dont ask me how or why, it just did :)

While I am here - can anyone supply me with the NSEW bounderies of the original map.bmp that came with the Wacars prog. I changed the map to a European one, and the co-ords as well - Unfortunately I didnt write down the original long/lat settings.

Once again many thanks

Slammer

Greeting to the group,

I've got an older radio that's not capable of digital squelch. All of the systems except one are the older CTCSS / PL subaudible tones. The next county just "upgraded" to d digital PL d311 to be exact. Is there anyway to trick the radio? Is there some type of equivalent in Hz for the DPL?

Thanks in advance

Anyone know where I can pick up light bulbs, for the backlight on the front panel of an Icom 7100? They are probably going to be a pain to install... :o(

Thanks in advance.
Regards,
Rolf

How about a Law banning the use of phones WHILE driving!!!
Where in the Hell do you come off making laws that scanner listeners
should bow down to?

THe ones who use cell phones while driving need to be eavesdropped or
have their company ban them from the highways and stick them in a
cubicle at work and not have any cell phones at all!

WHO in THE Hell Invented the Damn "Cell-phone"?
Cell phones during sex! Think about it! WHY?
Cell phones during weddings/funerals/ graduation ceremonies/ bar
mitzvahs?
Come on AMERICA!! GIVE THE PHONES A BREAK!!
Everywhere you go you see a phone "glued" to someone's lame ass head!!

Im a american and fuck you you forighner.

Leave the scanner communities ALONE!!!
Take your communist approach towards AMERICANS and GOTO HELL!!!

i deeply want to apoligize for my previous statement, i miss read your
statement, i thought it said to not towards.My error indeed.

The only thing I want to know is why you are using the 2.4GHz
frequency when higher frequencies are available that would produce much
better bandwidth throughput.

Dan,

I purchased mine when they initially came out, and I'm quite pleased with it. I also have an older Radio Shack Pro-46 (?) handheld & a Bearcat 8500 (?) - I don't have them in front of me to check the model #s. I use an ICOM Discone mounted in my attic and get excellent coverage for Prince William County, VA (where I am), with a pretty good reach into Wash, DC about 30 miles away. As far as I can tell PW county isn't using it's assigned trunked frequencies yet, but all other features of the radio work fine.

I also was a beta tester for WinScanRS, the remote controller for the Pro-2052. I recommend the program if you have a computer handy near your radio, it makes scanning much more enjoyable. There are several other programs available, but for the cost, this one is probably the best bet. You can find them at:

http://www.mghusa.com/pozilla/

You'll also have the opportunity to read a lot about the Pro-2052 if you follow the links.

Good luck,

Ed P.

From: longbch <longbch@excite.com>
Message-ID: <8do586$b9f$1@slb1.atl.mindspring.net>
Source record: 89806

Hello,

I have a Realistic PRO-2006 400 channel scanner for auction on eBay:

Here is the link:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=310761109

Model number 20-145A, serial number 011802, code 3A2.

Everything on this scanner is original and is in very good condition.
Flip-up feet, keypad, volume control, antenna, LCD and backlight are
all working fine. There are no scratches on the unit. The box and manual
are included.

Please e-mail me at longbch@excite.com if you have any questions about the
radio.

Thanks

I did all of this several years back, found I did not like it for several reasons.

1. It slows down the scanner.

2. Software is junk.

Just my opinion, do as you like.

Message-ID: <sfvi2f3ol6e16@corp.supernews.com>
Source record: 89812
Cross-posted to: rec.radio.scanner,rec.video.cable-tv

There is a portion of the 2.4GHz range that is allocated for unlicensed use of spread-spec gear. Note, however, that this allocation has *no* interference protections, and is used by numerous technologies (SST 2.4GHz "cordless" phones, new SST wireless LANs like Apple's AirPort, and several types of T1 point-to-point microwave systems). There's no recourse for Mr. Wireless Internet if someone comes into his service area and sets up a similar service. Both will suffer bandwidth reductions and reduced coverage area...

Wait for MCI/Sprint to roll out their 2.6GHz systems...they have the promise to provide multi-megabit wireless service to a large subscriber base AND they little around them (spectrum-wise) to interfere with them.

Most scanners also have very poor image rejection as well as poor
shape factors, and wide IF (much too wide for HF AM operation). the
AR8200 and the MVT-9000 are the notable exceptions. There is a widely
available mod to address this issue on the AR8000. Poor Image
rejection however is a fact of life on the DC to light products until
you get up past about $1000 where you see tuned front ends (Icom R8500
and 9000 for instance have band pass filtering up front).

If what you want is SW reception, buy an SW receiver. The Sony 7600
and Grundig YB400 are both good SW receivers that outperform the DC to
light scanners by a wide margin on MW and SW for less than 200USD.

1233. Re: Scout Battery

I used a store called www.batterystore.com to have a new pack built for my Scout. They can "spot weld" tabs to the batteries, which is the proper way of connecting to a battery, rather than soldering which can ruin the battery. They can connect from battery to battery with these tabs, or leave one end of the tab dangling for you to solder too. I have built custom packs with their Florida store and their California store. You will need to draw a very clear diagram of how to connect the batteries.

I agree about feeding trolls Chris, but my local police force makes public announcements once in a while on their
main frequency. For example:
"Attention all scanner listeners. School is closed today because of the snow"
There is no reason for privacy on the police band in our town.
The police have access to cell phones for sensitive private communications, when needed. Detectives use scrambling
on a very rare basis, and patrolmen use pay phones if they are not equipped with a cell phone for sensitive stuff.

I recently purchased a BC-220XLT scanner at a discount because the store had lost the manual and charger (I bought the display unit). I got a replacement charger at Radio Shack but I'm having trouble locating a manual. Uniden said they'd send me one but it's been over a month and now they don't respond to my emails.
Does anyone out there have a 220XLT manual they'd be willing to scan and email to me? Most operations are easy to figure out but I need a manual to make the most of my unit.

Sent via Deja.com http://www.deja.com/
Before you buy.

I believe you'll be out of luck if your radio doesn't support DPL
(DCS). You'll be able to hear them if you don't have a CTCSS receive
tone programmed in, but you won't be able to talk back, assuming when
you say "radio" you are talking transceiver.

Look at www.strongsignals.net and click on the "antenna" articles, they compare the 20-0176 and the discone 20-0013, some like one some like the other, for $20 I like the 20-0176, only 20 inches tall and very stealthy for my communist neighborhood which doesn't allow antennas. For pictures you need to stop by Radio Shack and get a catalogue, while you are there go ahead and look at the real thing! Know what kind of wire and connections you want before you ask them, they will try to sell you an fm radio and tell you it gets cell calls!

The problem with the handheld counters (like the Opto Scout) is their sensitivity is so low that you basically have to shove the counter right next to the antenna in order to pick up the frequency. I tried driving through the drive-thru with the Scout next to the window - nothing. I even tried walking past the speaker sign with the Scout in my hand - still nothing.

In short, frequency counters are not a panacea.

1248. FS: 2+ db Gain antenna for your BC245.Pro92 etc

Newsgroup: rec.radio.scanner
Date: 2000-04-20 00:00:00 UTC
From: Brian Gould <rmedic@frii.com>
Message-ID: <7BxL4.525$G3.188624384@news.frii.net>
Source record: 89892

This is a commercial Centurion (Tuff Duck) "ducky" style 2 way antenna. It is tuned for the middle of the 800mhz. band and provides around 2db gain at 860-870 mhz. What this means is significantly better reception and less instance of data channel loss when you are using your portable trunk tracking radio. I find it works very well in a vehicle and in fact equals or outperforms my external cellular mag-mount antenna. Others report that fringe area trunk tracking is much better with this antenna than with the stock antenna..

The antenna is appx 8" tall and uses no cheesy ground plane like some of the currently availible aftermarket 800mhz scanning antennas do. It has a covered BNC mount which matches the 245 perfectly and looks quite nice on the other radios as well. The covered mount also provides significant protection for the BNC base. The antenna is very tough and will more than likely outlast your radio (I'm not kidding)

I have sold 30 of these to date and have numerous positive testimonials available for you cynical rec.radio.scanner folks! :)

Note: This is a high gain 800mhz specifc antenna.. It won't work worth crud on any other band.

The cost is $28 delivered to your USA address first class.

I have references on request.

If you are intrested in this product or would like more info. reply to this email.

Thnaks!

Brian

Unsolder the battery (one wire will do), plug in the power supply and check for output on the battery connections. While I don't have the specs for this, it should be 7.2vdc or greater to the battery connections and 7.2vdc to the radio connections. The board components could easily look discolored due to the lack of ventilation in the pack yet still be functional. Final thought, if in doubt, don't! If your scanner is in good working order otherwise, spend the extra and get a complete pack. The BC-200XLT is a classic and it would be a shame to screw it up trying to save $15-20. After all, how much would you have to spend to replace it.

Hmmm. I haven't noticed this before... Can you provide a little more info on how many channels you have programmed, how many banks are being scanned, etc.? Are you saying that, for instance, you have channel 10 locked out, but it still stops on channel 10? Sounds bizarre! What did you do to move the problem channels around? Did Uniden agree that they observed the behavior, or did they just return it to you saying nothing was wrong?

Crash - I'd recommend the RS PRO94, a 1000
channel trunk-capable HH that normally sells for
$300 and is currently on sale for $200 - it's a good
unit even if you never use the trunking thing, and
with 1000 channels, it'll take a while before you
run out of space.

Sounds like you need the Channel Master Monitenna. Its around 10 feet tall and only costs around $30 from www.starkelectronic.com. It is the best lowband antenna I have ever used. I have cut my own dipole antennas with good results but the monitenna still outperforms them all.

Source record: 89758

I agree the Monitenna is a good antenna but every dipole I cut and TUNED to the frequency of choice was always equal and usually better than the Channel Master. Hey, it only stands to reason, they can't make it cover everything at peak performance. I checked it out once with MFJ 259 and found the peaks and valleys, just don't recall any longer where they are.

I just purchased a cable for the BC895xlt from Grove at:

http://www.grove-ent.com/ACC15.html

I ordered online, $35.90 with shipping, from the above site and it took
about 3 days for the cable to be delivered.

1266. Re: Birdies

Newsgroup: rec.radio.scanner
Date: 2000-04-21 00:00:00 UTC
From: grif@NODAMNSPAM.gci.net
Message-ID: <MPG.136ae67fd6fb1ac99896aa@news.gci.net>
Source record: 89760
Cross-posted to: alt.radio.scanner,rec.radio.scanner

Birdies are a result of internal RF resonance in the radio itself. As such, same models of scanners will tend to have similar if not exact birdies on various freqs. Variance of any particular model on any given freq IS due to variance in manufacturing quality. Quality manufactuers are able to predict, determine and hopefully publish thier suspect birdies. Due to the wideband nature of scanning and economic considerations, total elimination of birdies is a practical impossibility. Tho internal modification via shielding may help alot. The more insolated ferrous metal between PCB's or components the better.

It was my understanding that higher frequencies were license exempt
but that lower frequencies were not. I though that 2.4 Ghz was the
licensed area. I'll have to double check on that. But I definitely know
that higher frequencies are license exempt.

>

Sensitivity for the R-10 is actually quite high. But antenna
capture area is very low, so there isn't a lot of HF unless you use
a better antenna. But SW performance is still poor, because AM
reception is 12khz wide, or about 3 channels. SSB selectivity is
better, but still too wide to be of much value for what you want.

[I have deleted NG rec.radio.amateur.misc from my response because the topic has nothing to do with amateur radio]

As far as scanners and the legality of listening to any frequency goes, there's no reason for such laws now. The technology has progressed to such a point where privacy can be protected by encrypting the radio signal transmitted. Perhaps a LONG time ago (1970's), such a law could have been justified, but in 1986, when 18 USC 2510ff. were enacted, there was no technological sense to do so. It's merely a money-grab by the manufacturers (cheaper phones).

Tapping a wireline telephone vs. a radio communication are clearly two different things. With a wireline system, someone's property (either the owner of the location that has the phone or the telco itself) must be invaded to place the tap. With a wireless system, the RF energy invades YOUR property - there's no "tresspass" needed. I agree with some who take the radical position: "You don't want to have your cellular/cordless phone listened to? Then keep the RF off my property!"

Lately, the industry has come out with 2400MHz phones. 2.4GHz is also an amateur radio band and I have even listened to a neighbor using her phone because she's using it in a band where I am allowed to be, but the consumer is often not told about other users of the various bands (the same goes for 900 MHz). That's because the manufacturers treat those bands as "exclusive" even though their part 15 rating places them at the bottom of the pool, subject to interference from all licensed users (... but don't let the public know!).

I am considering purchasing the Pro-94..If i press the backlight button, will it stay on permanently until I turn it off. My Pro 90 only stays lit for about 15 seconds then turns off. Any other comments about this unit.

Thanks

If you have the clearance space, try a discone...but make sure you get a model which includes the vertical element on top. Not all discones include this element...and if yours doesn't, it will be "deaf" on low band.

If you don't have enough clearance space for this set up, I'd use Radio Shack's mobile scanner antenna with sufficient metal underneath it to create a groundplane.

1283. Uniden SportCat 200 any good????

Newsgroup: rec.radio.scanner

From: Matt in MI <mengelhardt@hotmail.com>
Message-ID: <8dpp90$t07@chronicle.concentric.net>
Source record: 89833

I have never owned a scanner before, and don't know much about them. I am looking for a scanner to listen to the drivers and pit crews during NASCAR races, and other closed course races. I wanted a scanner that has alpha tags, So I can tell who I am listening to when they key up. Is the SC 200 a good choice for this type of use, or would I be better off getting something else. BTW, the SC 200 can be had for about $175 online.
thanks,
Matt in MI

Yeah, cut a half wave dipole for 46.5 MHz. Mount it vertical, will out perform a discone hands down.

When you do find the frequency, have fun. I've taken my scanner and put it on 35.02 for the McDonalds, started giving my order and then held the scanner up to the speaker. The feedback drives them crazy!

Where did you see them for sale (not for bid) for $175?

I have used a scanner at the races for at least 15 years and this one looks like a winner to me. I am planning to buy one myself for just the same reasons you are, alpha tags. I also like its programmability from a computer. Spend the ten dollars and get an up to the minute frequency list from frequency fan club http://www.racescanners.com/ . They also have a person at the Winston Cup races who checks out the freqs during practice and they have an update they broadcast just before the race. They will also list the safety crews and the TV and Radio feed freqs. The feeds are fun to listen to as you hear what they talk about during the commercials (and they sometimes are not as friendly to each other as they appear on the air).

A common way of tracking cars is by entering the car number as the channel number (ie, Dale Earnhardt is channel 3). With alpha tags it is not that important.
You will need a headset. My trick is to use a pair of earbuds that also have a clip over the ear (Koss makes the one I use) and cover these with an industrial hearing protector or shooting ear protectors. That way, you can remove the muffs and still hear the radio during cautions. Regular earbuds without the clip tend to be pulled out of your ear when you put on the muffs (learned that the hard way).

There is not a whole lot of gabbing during racing, the drivers are concentrating and are listening to the spotters. Cautions are the times you hear the banter between the driver and crew chief.

I have also made a strap of wide elastic with Velcro to wrap around my leg. The radio clips to this strap and I can see it without having to hold it in my hand. Since I don't have alpha tags (yet), I print a copy of the car number and drivers and slip it into the back of my clear ticket holder that hangs around my neck. As you see, I like to keep my hands free.

Favorite things overheard on the scanner; crew chief literally talking Nigel Mansell through the Indy 500, Al Unser Jr. comments when spun out by Emerson Fittipaldi at Indy 500, Sam Posey and Bobby Unser almost coming to blows during a commercial break at Indy 500, Dick Trickle commenting about someone in a bikini at the Brickyard 400, Ray Evernham literally talking Jeff Gordon through his first Brickyard 400 win, comments between Dale Jarrett and his crew chief when he ran out of gas at the Brickyard 400, Felix Sabates and Robbie Gordon arguing over car handling at the Brickyard.

Hi Matt-

I have the SC200 and I like it a lot for non-trunking use. The only complaint I have is that once I got the radio fully programmed, I found that some of the channels I locked out of scanning still scanned. I sent the radio back to Uniden twice (and it was gone for 3 weeks each time) to no avail. The second time they sent me a brand new radio and still the same problem. It's reasonable to assume that this is a bug in the firmware of the radio. I did find that if I programmed the radio differently, the problem moved around to different channels but still was there.

At any rate I still like the alpha tag and CTCSS features of the radio. For the money it's a great little scanner and I'd reccomend it to anyone. I just present that one caveat for you to think about. I was not at all happy with the service (or lack thereof) that I got from Uniden.

Excellent response Bill.

I enjoy the use of the internet and consider it to be an
invaluble resource. I simply enjoy using radios. I
can't explain it. Maybe it's the fasination that a signal
can be transmitted hundreds and even thousands
of miles and still be picked out of the thousands of other
signals in the air.

I've noticed that the beginning of this thread was posted
to several radio newsgroups. Why would someone so
down on amateur radio be interested in any type of radio?
Won't they all be obsolete soon?

One other thing. My cable modem does not reach my
vehicles and I'm not sure if I would use it in the first
place. With the traffic around here your eyes need to
be on the road. I have changed my route to and from
work on numerous occasions thanks to other hams
on the road.

You talk worldwide on 2m? What about the expense of SOMEONE else's
repeater, just to extend the range, but still far from world wide?

You're talking apples and oranges.

Florida has a law on the books that forbids mounting a scanner in an
automobile unless you hold an FCC license. The law is not usually
enforced unless you piss off a cop. You are OK with a handheld though.

-----BEGIN PGP SIGNED MESSAGE-----

Scanner nuts ought to pay attention to at *least* one thing about ham radio--being licensed as an amateur, is also being "licensed" in many states, to have a mobile scanner.

I just built a 80m CW QRP rig--for less than $20. Most of the parts were laying around. Try to connect to the internet and communicate with ppl with about 13 parts or so, (and a part is not a "motherboard" or a modem--I'm talking discrete components) hand built in your home, and battery operated.

Not only that, I simply *love* the hobby. And I love the internet.

They are two different things to me, used for different purposes. Also, how many ppl with cell phones, stop to help ppl in need on freeways? What percentage? And think of how many ham operators would stop to help? Public Service is a very big part of ham radio. I live in the midwest--what good are your cell phones, and internet connections, when the towers have been destroyed by a tornado?? Or the CO has been moved a few blocks by one?

Maybe I'm sounding a little defensive. Ham radio is not for everyone, but for those of us who think it is worthwhile, are the ones who will be there in an emergency. And when there aren't any emergencies, we have fun talking to ppl all over the world, sometimes with home built equipment, as well as local ppl. I know I can travel to most places in the US, and with a handheld 2m radio, get directions, help, a friendly conversation with random ppl. Can't do that with a cell phone, not as easily. <imagines someone picking up a cell phone, and talking into it, going, "hey, anyone know of a good chinese rest. around town? And how do I get there from here?">

Cell phones have their place--and so does ham radio.

1305. Re: What is the position with scanners in Florida ?

Newsgroup: rec.radio.scanner
Date: 2000-04-22 00:00:00 UTC
From: riradiobuff@aol.comspamsux
Message-ID: <20000422144341.01422.00001814@ng-fx1.aol.com>
Source record: 89705

A very good website for scanner and radar detector laws is http://www.afn.org/~afn09444/scanlaws/scanner4.html. According to this website, the following is the law for Florida:

<<(1998 law; still effective in 1999) - Illegal mounted in vehicles unless you are either a licensed alarm system contractor, member of Press ON ASSIGNMENT (*note* that), licensed amateur radio operator, or citizen with written permission from Chief of Police of Sheriff of your community.>>

Note the last part... "citizen with written permission from the Chief of Police or Sheriff of your community"... also note that it says MOUNTED in a vehicle.. so that would imply to me that if you have a hand held sitting on your passenger seat, it's not illegal. As with anything, you should check with your state for the exact ruling.

Of course you're generally not going to get in trouble anywhere in the US for having a scanner unless you're using it in conjunction with a crime...

It's epoxy, put there either to vibration proof the board or to deter modifications. Heat the board with a heat gun or a hair dryer until the epoxy softens, then pick up one corner with an exacto knife or pick and peel the whole schmeer off in one piece. Do not attempt to cut or grind the stuff.

Why stop? My cell phone allows me to place a free call to the Samaritan truck or State Police, which I do all the time.

The last time I stopped to offer help, the "motorists" climbed a fence, jumped in another car, and split. It wasn't their car, they were breaking into it. Luckily, they weren't armed. FWIW, this was NOT in a bad area, it was on Rt. 84 in a suburban area of Connecticut. Since then, I don't stop, I call professionals.

Thanks for reading my post.

1) PRO 2021 200 channel base/mobile scanner, with mounting bracket/hardware,
screw in antenna, and original manual, NO box. Has attached AC cord, and
will
include DC (lighter plug) cord. Display light works fine. No mods done -
works and looks good. Covers 30-54, 108-136, 138-174, 380-512 MHz.
Asking $80, OBO.

If you have any questions, please e-mail me.

Never said I did that. Some people talk worldwide mobile
on HF.

>What about the expense of SOMEONE else's
>repeater, just to extend the range, but still far from world wide?

Why do I care about the costs of someone else's repeater?

>You're talking apples and oranges.

You have no clue at all about what you are talking about.

Note that a handheld scanner may be considered "mounted" to the vehicle if
it is attached to an antenna, mag mount or other, which has been attached
to the vehicle.

Spotted: Frequent helicopter activity into a site on the east
side of Dickinson, Texas. A quick drive by-revealed a sign
reading "CREW 41 STAGING AREA", a radio mast, and trailers.
An advance base for United Nations troops?

A closer look at the sign said it belonged to Veritas DGC Land.
Their web site showed that they do seismic work. After a quick
trip to the FCC data base, the PRO-2006 found 'em on 153.23 MHz.

How did we ever figure this stuff out without the Internet?

this is available with diagrams at:
http://www.designeq.com/PRO-43Mod.html

Modifying the PRO-43

Copyright 1992, 1996 by Howard Bornstein
(Revised: October 18, 1994)
(Revised: August 8, 1996)

This document may be freely distributed for all non-commercial purposes as long as it is distributed unchanged and complete.

This document describes how to perform three modifications to the stock PRO-43 Scanning Receiver. These mods will:

o Restore the base and mobile cellular bands in the 800 MHz range
o Restore the 54-88 MHz range
o Drastically reduce the volume of the PRO-43 beep sound

When you restore the cellular bands, the scanner will automatically search at the correct 30 KHz increments while in the cellular bands. The 54 to 88 MHz coverage is primarily used for TV audio in the US (channels 2 through 6), but is used for police and other services in parts of Europe.

IMPORTANT NOTICE

Due to the requirements of FCC Part 15.121 subpart A, Radio Shack has modified the production of the PRO-43 and come out with a new model, the PRO-43A. This model can not be modified for cellular reception. The other two mods, 54-88 Mhz restoration, and the beep delete, are still possible on the new units.

You can determine if your PRO-43 is fully modifiable by looking at the FCC ID number on the back plate. If it reads: AA020-300, then it is modifiable. If the ID number ends with an "A" (i.e. AA020-300A) then the unit is not modifiable for cellular.

Why delete the beep?
When you press the keys on the PRO-43, it responds with an audio beep to let you know that the key has been "accepted" by the scanner. This kind of

feedback is usually desired, particularly since the keyboard of the PRO-43 doesn't provide tactile feedback. Then why kill the beep? Because the beep volume is fixed on the PRO-43 (that is, it is not set according to the volume control knob), and, at the same time, the volume is not equalized between the speaker and the headphone jack. Because of this, while the beep volume is not a problem with the speaker, when you listen to the scanner using headphones or through an amplified system like your car stereo, the beep has the effect of a concussion grenade!

The mod reduces the beep volume from the speaker to a very soft level (you have to be in a quiet room to hear it) and to the headphone jack to a comfortable level.

Some things to consider before killing the beep:

If you kill the beep, you won't get (from the speaker) the normal indication that the batteries are very low. In the case of the PRO-43, because it stores your channel frequencies in permanent EEPROM memory, you won't lose anything if your batteries go dead. All that happens is you probably won't notice for a while that the scanner is not scanning anymore.

Another positive side of killing the beep is that when you use alkaline batteries, you may have as much as three full hours of usage after the scanner thinks that the batteries are low. This mod keeps you from going batty listening to that beep for those three hours.

You do lose, however, the feedback the scanner gives you when you enter an incorrect entry. Say you are going to program in the frequency 455.675. You enter in the 455 but don't hit the decimal point properly. If you could hear the beep, you would notice it stop beeping after pressing the second 5 (because it thinks you are entering a channel number that is outside of its range). Without the beep, you have to rely entirely on the LCD display to tell that something is wrong. Not a big deal, but there are several kinds of operations that the PRO-43 helps you with that are similar to this one.

Performing the modifications:
You should have experience soldering and should feel comfortable working with very small parts to perform these mods.

Tools:
You will need a small Philips screwdriver, a small slotted screwdriver, small needle-nose pliers or tweezers, a low-wattage soldering iron, and a solder sucker or solder wick. A magnifying lens of some sort (eyeglasses or lamp) and a high intensity lamp are highly recommended!

All the references to positions assume that you have placed the PRO-43 with the keyboard side down and the antenna at the top.

Procedure:
1) Remove the antenna and the battery pack. Then remove the 4 black Philips screws from the back of the case. Put these and all other screws in a secure area.

2) Pull the back case off. The case will separate near the front of the scanner, revealing the stacked circuit boards inside. Place the scanner down on its face. You will encounter three circuit boards. The top board is the one you will see looking directly down. There is a second board in the middle, and the third board is the board that has the keyboard attached to it. The top and second board are connected together and will move as a unit.

3) Remove the six small screws from the top circuit board. Place these screws in a secure place.

4) The top and middle boards are connected at the bottom left by a small black 4-pin connector. Take your small, slotted screwdriver and use it to carefully pry up the black connector at the bottom of the top circuit board. A good place to pry up the board is above the metal shield on the left, bottom edge of the board. Once you lift up the top board by freeing this connector, you can shift the top board slightly to the left and right. By shifting this top board to access the screws underneath, you will not have to desolder the antenna connections.

First, shift the top board to the right so that the Philips screw on the lower left edge of the middle circuit board is exposed. Use your small Philips screwdriver to remove this screw. You may need to use your needle-nose pliers to grab this screw once it's loosened.

5) Shift the top board to the left so that the screw at the lower right edge of the middle board is visible. Use your small Philips screwdriver to remove it. You may have to angle the screwdriver slightly to get to the screw. The needle-nose pliers may also make it easier to remove the screw. Store these screws with the others.

6) Once both screws are removed from the middle board, the whole unit of the top and middle board will lift out and "fold" over to the left. In order to lift up, you have to disconnect two connectors along the right edge of the middle board. There is a small connector near the top right of the board and a longer one along the middle right edge. Again, use your slotted screwdriver to carefully pry these connectors loose.

(To delete the beep)
7) After you've folded the two boards to the left, look at the bottom of the second board. In the upper half of the board, nearer to the left side, you will find a small surface mounted resistor with the number "471" on it. To defeat the beep sound, you need to remove this resistor. Heat the connectors on each side and use the sucker or wick to remove the solder. Even after you remove the solder, the resistor may still stick to the board. Try using the edge of an Xacto knife to pry it up if it sticks. Otherwise, use your tweezers to pick it up. Try not to destroy it, since you can re-install it if you want to restore the beep. Tape this chip to the back of a business card or something similar for safe keeping.

8) Now look at the bottom circuit board. There are a set of five diodes that affect how the scanner scans. They are covered by the metal RF shield. Desolder all four tabs that hold the RF shield in place. Use your screwdriver to put a slight upward pressure on the shield near the tab you

are heating and it will pop right out. Remember the orientation of the RF shield so you can put it back the same way when you re-assemble the scanner.

9) After you remove the RF shield, locate the row of diodes. The labels are not quite lined up with the diodes themselves, so be sure you can identify which diodes are which. In a normal US PRO-43, you will see diodes 1, 2, and 4 installed. Diodes 3 and 5 are not present. These diodes are extremely small so you will have to be very delicate in handling them.

(To restore cellular)
10) Remove the solder on each side of diode 4, using the solder wick or solder sucker. With tweezers, carefully lift diode 4 off the board. These are surface-mounted components, so the leads are not soldered into holes in the board but are attached directly to the surface of the board. If you use pliers, be extremely careful, because you may crush the diode. You will still get cellular restored, but you will not be able to place the diode in D3 to restore 54-88 MHz.

(To enable 54-88 MHz)
11) If you were able to lift the diode off intact, place it over the pads in the space for D3. Keep its orientation the same as it was on D4. Carefully solder the diode in place. For your information, the diode matrix performs the following functions: Diode 1, if removed, disables the keylock switch. If in place, enables the keylock switch. Diode 2, if in place, enables the 30-54 MHz range. If removed, disables 30-54 MHz. Diode 3, if in place, enables the 54-88 MHz range. If removed, disables 54-88 MHz. Diode 4, if removed enables the cellular bands. If in place, locks out the cellular bands. Diode 5, if in place, steps the cellular bands in 12.5 KHz steps. If removed, steps in 30 KHz steps.

12) Resolder the RF shield on, being careful to replace it in its proper orientation.

13) Take the top and middle circuit board unit and fold it back to the right, lining up the pins for the right edge connectors.

14) Replace the screws in the middle board, again, by shifting the top board to the left and right. You may need to seat these screws in their holes using your needle-nose pliers or tweezers.

15) Insert the black connector at the bottom of the top board, and replace the 6 screws in the top board.

16) Replace the back case, replace the 4 black screws, replace the battery pack and the antenna.

To test the unit:
Enter the following key sequences:

PGM
LIMIT
870
ENTER

LIMIT
896
ENTER

Now press the up arrow. The scanner should now be able to search through the cellular base range. It will use the proper 30 KHz steps.

Now try:

PGM
LIMIT
54
ENTER
LIMIT
88
ENTER

Again press the up arrow. The scanner should now search through this low band range of 54-88 MHz. It will step in increments of 5 KHz.

If you performed the beep delete, you will notice that the beep sound is very quite through the speaker and comfortable with headphones.

Note on TV audio frequencies:
The range of 54 to 88 MHz is primarily used for TV audio of channels 2 through 6 in the US. TV audio is broadcast on wide-band FM (WFM). The PRO-43 only receives FM in narrow band FM, which means that the quality of TV audio won't be perfect. It should, however, be very understandable, which means that you will be able to listen to the six o'clock news (for example) on some of these channels with no problem.

TV audio frequencies:

Channel 2 59.75 MHz
Channel 3 65.75 MHz
Channel 4 71.75 MHz
Channel 5 81.75 MHz
Channel 6 87.75 MHz

Note on cellular restoration:
There is much controversy about the 1986 ECPA legislation which made it illegal to monitor cellular communications in the US. You should be aware that the law makes it illegal to monitor these communication, not possess a device that can monitor them. In other words, it is not against the law to modify your scanner to pick up these frequencies. It is just against the law to listen to them! Please use good judgement if you make this modification.

Note about Radio Shack and the modifications:
I certainly cannot speak for Radio Shack, but many scanner enthusiasts have found that making modifications such as these will not necessarily void your warranty. While it might do so technically, it seems that, if the mods are not related to other problems that you have with the unit, Radio Shack may very well fix the unit under warranty and leave your mods in place!

Note however that the PRO-43 has since been discontinued as a product and the original digital boards that supported the cellular mod are gone from inventory. As Radio Shack rarely does component-level repairs, it is likely that a new, non-modifiable digital board may be swapped in during a repair. You may want to make arrangements with Radio Shack not to swap the digital board if they would ordinarily do so and try to find someone to repair your unit at the component level.

Thanks very much to Jeff Goldman, Bob Kelty, Gary Ross, Todd Handley, R.G. Schaffrath and others who helped pioneer these mods and discover what makes the PRO-43 tick inside.

1339. BC890XLT selectivity question

Newsgroup: rec.radio.scanner
Date: 2000-04-22 00:00:00 UTC
From: T Kester <trkester@ameritech.net>
Message-ID: <L3tM4.1316$sf5.31033@nntp0.chicago.il.ameritech.net>
Source record: 89739

Hi all,
I'm pretty new at scanning so forgive me if I get terminology messed up.

Anyway, I have a BC890XLT with a 108-1300 MHZ antenna on 20' of mast. I live within 4 miles of Detroit Metro Airport.

Here's the problem. While scanning my favorite marine freqs 156ish Mhz, I end up hearing aircraft "bleeding" through. I'm confused because aircraft operate between 108 and 136 ish AM, and I'm in the 156 range FM.

What's up? The receive on this radio seems great, I'm getting all the Detroit River traffic just fine, but I'm getting this unwanted bleedover too. I called Uniden and the customer support guy was pretty much useless. He more or less said that's life. Is this just poor selectivity on this radio? Am I totally confused? All of the above?

Lastly, if this is just the way of the world for me, can anyone suggest any kind of filter/attenuator that may help out with this problem? I do enjoy listening to aircraft, but only when I WANT to and not at other times.

Thanks for your suggestions
Terry

1340. MultiMode 3.3.0 Released

Newsgroup: rec.radio.scanner
Date: 2000-04-22 00:00:00 UTC
From: csmolinski@erols.com

I've released version 3.3.0 of MultiMode, the digital modes decoding (and transmitting) software package for the Macintosh.

The latest version adds 300 and 1200 baud packet radio (recieve only). There have been lots of requests for packet support in MultiMode, so here it is!

MultiMode is shareware, a copy may be downloaded from the following URL:
http://www.blackcatsystems.com/software/multimode.html

This part is confusing, isn't it? And not much change; it's the other part, that imposes restrictions on receivers and what we can do with them (the Senate version would have offenses handled by the FCC, not by the courts, where laws can be struck down as unconstitutional), we need to worry most about.

Cortland

Anyone know where I can buy a 800mhz converter kit? Is it true that you cant search the 800mhz band, but instead you have to program in it each frequency?

>info on how many channels you have programmed, how many banks are
>being scanned, etc.?

I had all but bank 10 partly to mostly filled. I would normaly scan
bank 1 only. Channel 17 seemed to be a problem for me. At one point
17 was OK but 19 was a problem. I would set the L/O on the channel
and it would still scan. I theorized that because I used this freq on
a different channel with a different PL that maybe the dupe freq was
causing the trouble. I entered one of the local NOAA freqs and locked
it out and it still stopped there. I can send you a copy of my freq
list if you're interested.

At one point i decided to scan bank 3 only. Guess what? The scanner
was also scanning bank 4 although only 3 was selected.

> Are you saying that, for instance, you have
>channel 10 locked out, but it still stops on channel 10? Sounds
>bizarre! What did you do to move the problem channels around? Did
>Uniden agree that they observed the behavior, or did they just return
>it to you saying nothing was wrong?
>

Uniden said NOTHING!!! There was no service report included with the
scanner when I got it back. I assumed that the problem was found and
fixed. After hours of manually re-entering all of the information the
problem was still there. Even with the new radio I have the same
problem. I will say however that I don't notice the bank 3 & 4 thing
anymore.

So... I've found a workaround. On the channel in question I've
entered an invalid PL tone which seems to work but it's not as quick
on the fly as the L/O would be. I'm very disappointed in Uniden.

Yeah, I've worked quite a few of these places, at elast for a few
months before I got sick of numb nuts who held scanners to the
speaker--they got the similiar treatment to the pizza customers who
never tipped--I used the pizza box as a frisbees when I took it out
of the store, of course, they got a free pizza--about 3 hours *after*
they ordered it. Or mixing 1/3 diet into their regular coke--tastes
a little funny, but not enough. Don't screw with the drive through
ppl--they always get the last word :)

Anyway, I studied the actual systems whenever I got the chance
(including playing with them after close when I was a manager and the
only one there), and even once got a hold of an old antenna (great
for VHF Lo scanning) The McDonald's onesa for VHF Lo looked like a 3
foot scetion of 1/2" PVC pipe, with a T section in the middle,
usually mounted on the cieling, right above the window where you got
your food. The newer UHF ones have a little antenna strand hanging
from the box (like garage door opener rcvr antennas).

-----BEGIN PGP SIGNED MESSAGE-----

Maybe a picture of how the system works will explain it a little
better :)

The fancy name for the system used, is a Full Duplex, Cross Band
Repeater. The freq. and CTCSS (PL) tones used are not necessarily
the ones used, just ones picked to demonstrate.

Most of these systems transmit 24/7. Finding the output freq should
be easy--even at 3am, as it is *always* transmitting. The output of
the repeater constantly transmits on 35.02--even if there is no
input. It is also constantly listening to it's input frequency.
When it detects a signal on the input, the first thing it does is
check for a CTCSS (or PL, tone). If it finds the first correct one,
it retransmits it on the output (in this case, it's 141.3Hz). This
is the "intercom" "freq.". When it detects the second CTCSS tone,
(114.8), it also opens up the Drive-Thru speaker, thus, talking to
the customer. The DT speaker also has a microphone--and it's
directed to the transmitter (T).

Here's an example of a "typical conversation":

Car pulls up to Menu.
(sonar detects this, sends signal to control unit. CU opens up the
microphone on DT MenuBoard, and sounds a "bong" or other indicater
vehicle is there. Noise is now heard on outpur freq, instead of dead
carrier.)

"Hi, welcome to McSucky Foods, Would you like to try our suggestive
selling menu item today?"
(Order Taker pushes button 1--this activates their 154.6 HT, with a
PL tone of 114.8, which sends this to the DT and the Xmtr)

"Yes, I'd like, a McColesterol (sp?) Value meal."

"And to drink with that?"

"Yes, I'd like a drink"

(At this point, Order Taker pushes button 2--this activates their
154.6 HT with a PL tone of *141.3*. This does *not* go to the menu
board. However, the three others wearing headsets, and us scanner
nuts, hear this):
"no shit, moron. *Which* one?*"
(They then press button 1)
"And what kind of drink would you like with that?"

"Oh. A Coke."

(OT pushes button 1 again)
"OK, your total comes to $4.18. Please pull up to the *2nd* window."

Crustomer then pulls up to the first window, which is locked, and
barred, and stares at Cashier at the next window for 25 seconds.
Cashier pushes button 2. We, and the other workers hear:
"Look at this idiot. Can't even count to two."

Driver finally pulls up to window--finishes transaction.

Hopefully this sheds some light on the subject. Any serious
questions, email me--I'll do my best to answer.

And just to head some of it off, here's a mini FAQ:
Q: Do you guys *really* talk about the customer like that on the
"intercom"?
A: No. It's usually much worse than I would post ehre.

Q: Do you guys think customers are that stupid?
A: Yes. If not more. There seems to be some sort of IQ robbing
device near DTs--even the most intelligent seem to dumb down. Actual
quote, heard far too many times early in the morning: (Customer is at
DT) "Oh, and, that's to go."

Q: Do you know ppl are monitoring?
A: Most, no. The ones who did, did we care? No--we weren't paid
enough to care.

Q: Can you really screw with the customers with a business band
radio?
A: Sure can! Just find out the PL tone first for the Menu Board.
The 5w HTs work great because of the FM capture effect, as the HTs
used are less than 2w, if not about 500mw.

From: NP <alpha2@mail.netlabs.net>
Message-ID: <3901476C.5BEB0082@mail.netlabs.net>
Source record: 89775
Cross-posted to: alt.radio.scanner,rec.radio.scanner

That is a great question that I'd like to have answered too. I
had a
lot of birdies on my radio. I got rid of some of them by
clipping all
of the extra wire projections from parts (resistors, caps, etc..)
on the
solder side, and anywhere else that had extra wire (little
antennas).
I also put in extra insulated metal shielding inside between ckt
boards.
I found some copper mesh that I formed around the outside plastic
case.
I plan to add extra shielding between the antenna and where it is
soldered onto the ckt. board. I'm also thinking about replacing
the
plastic case all together with a home made metal casting.

Sounds like your input section amplifiers might be damaged. My
counter
was working fine till I got too close to a high power
transmitter. It still worked but was not very sensitive.

Have you tried filters between the antenna and the counter. It
increases sensitivity.

NP

Psychological Warfare is real, whether directed at an army or
just
one individual. The EEG measures electrical activity in the
brain.
They found ways to influence and alter these signals and the
underlying
thought and nerve activity from a distance. If you say anything
or
complain to the police, you are locked up in a nut house,
discredited,
and anything more that you say appears to be from just one more
nut.
Psychological Manipulation with these weapons is devastating.

Since EBay has made selling "open" receivers illegal, I'm posting it here.

I have a new Standard CCR708A in the box for sale. This is a wide band test receiver with spectrum scope that covers 50 to 905 Mhz. Absolutely immaculate with all standard accessories and literature. Please read the spec's and see a brochure picture at;

http://hometown.aol.com/ki3b/myhomepage/index.html

Asking $760 shipped insured via UPS Brown CONUS. I will accept Visa/Master Card by using PayPal. Go to http://www.paypal.com for more info.

But it is no longer UNIQUE and this is the root issue here.

It used to be that ham radio operators we the ONLY people
in the neighborhood who could communicate in realtime with
people in other States and Countries, from either their car
or home.

This is no longer the case today. The public now has Internet, Cellular
Telephones, E-Mail, Chat Rooms, FRS Walkie-Talkies. Soon it will be
HDTV and Cable Providers co-joined with the Internet.

The UNIQUENESS of ham radio has been supplanted by newer and much less
expensive
communications technology, which is readily available to the General Public,
from WalMart
to Radio Shack and everyplace in-between. Again this is the reality of
today.

Face it guys, ham radio has become OBSOLETE. And that gentlemen, regardless
if you
choose to accept it or not, is the plain truth of this whole issue. I may
also add that in lieu
of all these personal communications devices, why should the public care
about ham radio?
Even Citizens Band radio is in decline! It's OBSOLETE technology also,
unless you drive
on the Interstates alot.

> No wires, no help from internet providers or telecom companies, just you
> and the other guy and miles of "ether."

Please try to send me a 3 megabyte MP3 file via the Internet, and via Packet
Radio
side-by-side. Guess which service will deliver it faster and more
efficiently?

> Relax and remember you're participating in the world's greatest hobby,

That is as technologically obsolete as the tube type radios many hams still run and
just as inefficent also. Sorry to keep harpin on this, but it's the truth that you hams NEED
to hear. Don't believe it? Read any article written by Wayne Green in the past 5 Years
concerning the outlook for this hobby. He's one of the FEW gems we have in this hobby that
knows anything about what is really going on, and how ham radio will probably be dead by 2015.

> Scott Rosenfeld ARS N7JI

A mild contadiction to above remarks. In our area the number of ham radio operators has at least tripled in the last twenty years. The big changes are the methods and frequencies used at the present time. Technology has certainly helped a lot to promote ham radio. Even most hams have not heard of internet linking via ham radio. Over the last two years it has been and is still being developed by a few hams I know in the area. With as tittle as a hand held radio I can communicate to many cities in Canada, and a number of them that are on line in the United States. More are coming on line all the time. Eventually it will be world wide. I am all for the internet as it provides me with information and entertainment, and now with a brand new and very unique form of communications. But when the internet gets hacked or your computer crashes the ham radio operators that are prepared will still be communicating on the airwaves.

except that, generally, it's considered poor form to ring someone you
dont know up with your cell phone in new zealand. ham radio is
designed for that purpose; cell phones arent. and radio is its own
technology. just as there are computer geeks there are radio geeks. we
enjoy building stations, towers, antennas, knowing propagation,
etc...these are aspects that other technologies cannot replace.

>
>Face it guys, ham radio has become OBSOLETE. And that gentlemen, regardless

>on the Interstates alot.

those of us on the ham radio maritime mobile service net who
participated in the rescue of a young boy on a sailboat off the coast
of honduras know this is wrong. the boy's family was attacked by
pirates and he was shot. the ONLY successful means of communications

his family had was amateur radio.

as i was sitting in my shack last sunday morning, N4QDB/C6A called on
our frequency. he stated a boater nearby had a heart attack and they
needed an emergency phone patch to the coast guard to authorize a
night flight to a hospital in the bahamas. i quickly patched them
through and the flight was on its way in minutes.

these are merely 2 concrete, real examples of why ham radio is not
obsolete...merely philosophizing about the obsolesence of ham radio is
meaningless in the face of the reality of its usefulness.

try to get help for your bleeding kid at 3 AM 200 miles off the coast
of honduras with the internet. try to get help for a sick kid in the
jungles of honduras on the internet...

ham radio helped. the internet didnt.

>But it is no longer UNIQUE and this is the root issue here.

It is still unique for almost anyone you can find. Indeed,
what remains UNIQUE for the ham is the NO cost involved.
Sure I can call globally with a cellphone, but take a look
at the bill that you get once it comes in. My annual
telephone bill for home is greater than the total costs
I have inveted in all my ham gear...and that includes
an HF transciever, a mobil 2m and a dual band HT.
My 2m mobile is used, cost me $100. That has provided
me with untold hours of pleasant discussions, heads up
traffic info, etc during my daily commutes. The cost
to me is $0 per minutes of use.

>It used to be that ham radio operators we the ONLY people

You have to go back to the 40s or earlier for that
to be true. International telephone capability has
been around for a VERY long time.

But there never was a host of newbies lining up to
become hams anyway. All the kids are more technology
oriented than in the past as is the general public.

The JOB is for US to seek out those youngsters and
people who, for whatever reasons, DO find an interest
in ham radio and what it offers. Indeed, it must offer
something to us or we wouldn't have the over 1/2 million
licensed hams we do in this country.

All is NOT doom and gloom for ham radio in
comparison to other technolgy interests. Ham radio
always had only a niche market following and that
still exists.

The public never did care. The hams are the ones that
care. The public cares when we step up to those
occasional emergencies and become IMPORTANT in their
daily lives.

>Even Citizens Band radio is in decline! It's OBSOLETE technology also,
>unless you drive on the Interstates alot.

Actually, FRS does better for the family today anyway.

>> No wires, no help from internet providers or telecom companies, just you
>> and the other guy and miles of "ether."
>
>Please try to send me a 3 megabyte MP3 file via the Internet,
> and via Packet Radio side-by-side. Guess which
>service will deliver it faster and more efficiently?

The PURPOSE of ham radio is NOT to be that medium
which is in competition with the internet's transport ability.
Let me also turn your question around...which service
will provide you wth the ability to communicate in
the middle of a widespread flooded area with NO electric
power from the commercial sources?

>> Relax and remember you're participating in the world's greatest hobby,
>
>That is as technologically obsolete as the tube type radios many
>hams still run and just as inefficent also. Sorry to
>keep harpin on this, but it's the truth that you hams NEED
>to hear. Don't believe it? Read any article written by
>Wayne Green in the past 5 Years

So please tell us all why the police, fire, rescue squads don't just
abondon radio communications and go to all that wizz-bang
internet and/or cell phones? It wouldn't have anything to

do with conventional radio still being the best for their
purposes would it?

>concerning the outlook for this hobby. He's one of the FEW gems we have in
>this hobby that
>knows anything about what is really going on, and how ham radio will
>probably be dead by 2015.

If you mean Wayne Green, then you need help.
Ham radio will change, it has changed and it will
survive. Of that I am certain.

Cheers,
Bill K2UNK

check out www.national-electronics.com they sell the sportcat 200 for
$174.90 plus around $10 shipping. I am pretty sure this is the scanner I am
gonna get, especially after the mostly positive things said in here. I
don't think i will have the problem of locking certain channels out, since
the races is all I will use the scanner for.
thanks for the info,
Matt in MI

F.W.I.W. Ham radio provided needed emergency communications during the hurricane season last year when all other forms of communication, cellular, landline (including Internet), police and fire systems were shut down by floodwaters. I read of a young, teenaged ham operator who responded to his local EMA and provided non-stop communications via a 2meter rig and a mag-mount antenna for something like 2-3 DAYS! His was the only means of communication this area had in that period of time.

Most of the spotter groups here in the mid-west rely on 2m/70cm ham radios for weather reporting because these are the systems most likly to still be usable if/when severe weather strikes.

Even relatively small area disasters can disrupt normal communications. The Okla. City bombing is a case in point. The cell towers and landlines in the area were gridlocked and as such unusable in the first 3-6 hours after the bomb went off. Even police/fire/EMS radios were jammed with traffic and barely usable.

Practical example: I work in an industrial plant. This evening severe weather was forcast for parts of my state (Okla). I didn't have ready access to a phone, the internet was out of the question, as were TV and radio. But my trusty 2m HT kept me informed as to what the weather was doing. Cellphone? What would I do? Call the radio or TV station every fifteen minutes and ask "What's the weather doing now?".

Each technology has it's place. Don't count ham radio out yet.

You were comparing your PHONE BILL with the cost of your 2m equipment.
That's apples and oranges. YOU said a global cellular call would have a
large bill, as true as that is, it has nothing to do with 2m. I was
responding to your post.

Ham radio has value as an electronics training medium, but it's true
communications value is obsolete. We keep hearing about how the hams
will save the day when all other communications are down. I work for
one of the four largest telecomm companies in the US. Due to
competition and deregulation, the current phone network is unbelievably
redundant, the chance of a total failure is probably nil. The weak
spots in telecom are all exposed to weather, as in outside plant, and

with current diverse routing, even they aren't that weak. Once apon a time when there was ONE local phone company and ONE national connector, the chances of failure were much greater, and even then, it never really happened.

I listen to plenty of traffic on 2m, 6m, 1.25m, and shortwave. How many times can you guys do radio checks? <G> Unforunately, most hams are NOT all that knowledgeable when it comes to electronics these days. They THINK they are <G>, but most of them are simply appliance operating rag chewers. A typical ham's last piece of "electronic" experience was installing a mobile appliance in a vehicle. The only people I often hear talking about anything other than the weather or the last micron they adjusted their antenna are the losers on 3950 on Saturday night.

Could you fix, or at least troubleshoot to a proprietary component, your own HT?

I'm not a ham operator. I've studied all the tests, and every year I purchase the ARRL Handbook, as I am an electronics experimenter and it's a terrific resource. One of these days when I can actually get to a session, I'm going to take the simple Tech test, or whatever the current version of that is. I can pass test after test of the theory tests provided on the online test sites, for all of the license classes. I have ZERO interest in learning Morse code, so I'll never progress beyond the Tech, except for the commercial licenses which don't require code.

That would depend on his father. In this case, Elian's father hasn't seen the kid in 3 years. But that point is moot. Claims by the Gonzales family that the father called to alert them of Elian's coming by raft are also moot. As are the issues of his welfare in his father's custody. The father has already told us that he will return to his village, while Elian will go to Havana. He will not be with his father. He will be with the Cuban authorities who will erase the memories of the toys, the puppy, the trip to Disney, and his mother, before being put in the cane and tobacco fields as part of his 'education.'

A boy, in most cases would be better off with his father. But that's not going to happen here. The only time the boy will spend with his father is the time prior to the plane landing in Havana. At which time Elian will spend his time with Castro's goons.

What about S.A.M.E? AM/FM broadcasts to a pocket radio? The HT is a
great way to keep informed, but it's not the only way.

hmmm...wonder if KH2TD, the ham whose son was shot by pirates off
honduras would agree with that....or if the sailboat who called me
about a heart attack last week would agree....both these hams relied
on ham radio to save lives.

if its value as communications is obsolete, there are several people
who are alive today due to this 'obsolete' communictions.

We keep hearing about how the hams
>will save the day when all other communications are down. I work for
>one of the four largest telecomm companies in the US. Due to

of course, when I established a nightly communications schedule with
the virgin islands 3 yrs ago after theyd been hit by a hurricane and
had NO communications, or when we hams did likewise with puerto rico
last summer....

this sounds like sour grapes from someone who doesnt operate ham
radio. he's not familiar with it. all his 'knowledge' is
theoretical.

Nope, not an expert, but not sour grapes either. This is a "discussion group", group correct? By sharing my opinion that dosen't agree with yours, I'm an "expert" with sour grapes? <G> I'll agree with you completely on the values of HF on the high seas, and to underdeveloped areas as you have cited. My primary thought is the amateur radio service vs. current, easily obtainable communications tools. That's where _I beleive_ (My opinion, hence discussion! <G>) the obsolete part to fit in. As for it being FUN, no doubt! The examples you cited? That's not where this thread started. It started on topics such as contacting others from the car on the way home from work.

Good overall scanner as long as you don't have any transmitting equipment in the house.
I was using one and a friend called me on the local 70cm repeater. At about 25ft away, 5 watts on UHF will completely wipeout the front end of the Sony. Not a very selective unit.
The computer interface is nice on the PC1 but the software is clunky and a pain to use.

Dan

Lulu <titilulu1@email.msn.com> wrote in message news:etC30gIr$GA.295@cpmsnbbsa04...

Can anyone tell me your thoughts on the Sony ICFSC1. I'm new at this and would like to get a handheld scanner that will cover the most frequencies for not so much money. I am most interested in cordless frequencies, police, weather, fire, aircrafts. Thanks for your advice.

I'll agree with you
>completely on the values of HF on the high seas, and to underdeveloped
>areas as you have cited.

now THAT makes sense...we should keep the discussion in perspective.
infrastructure like satellites, cell phone towers, etc, are fairly
expensive and prone to attack (satellite rx/tx centers are, that is,
not satellites :-))

and those areas will always exist...

My primary thought is the amateur radio
>service vs. current, easily obtainable communications tools.

but that was never its purpose. if thats the purpose of ham radio, it
was obsolete the day it was born...

Get your information straight. The father last saw his child on the Friday befor the ill-fated boat voyage. There have also been photos of Elian with his (then) 2-month old half-brother.

I also left Miami two years ago because of the Banana Republic mentality. It's easy to criticize unless you have lived in the area--you begin to feel you don't live the US anymore.

Source record: 89625
Cross-posted to: alt.radio.scanner,rec.radio.scanner

If your scanner is capable of searching in 410-512 MHZ range, then you can connect a GRE SuperConverter II to your scanner input BNC connector, and your antenna coax BNC connector to the Converter's BNC female input and make sure a fresh 9-VDC battery or powerpack is connected to the SuperConverter II with the power switch on.....then you can pick up 810-912 MHZ, which will be heard on 410-912 MHZ on your scanner! The cell frequencies on 869-895 MHZ will be heard on your scanner between 469-495 MHZ!
There's just one small problem.....I believe the GRE SuperConverter II has been outlawed in most oppressed countries in which cell phone privacy is encouraged, and therefore you may have fun finding one! I believe we can still use them in Canada, because here it was decided that it's O.K. to listen to anything, as long as what you hear is not divulged, used or abused anywhere; but no one wants to make them or supply them to us.

So it is claimed. There was also a picture published of a happy
Elian with his reunited father showing in his big smile, two teeth
that were clearly missing only a few hours before.

Getting STRAIGHT information is precisely the challenge in this
matter.

Yes, I know. Been there, done that. I live in Chicago, and have
had conversations with Cuban ex patriates who left Miami for that
very reason. And their descriptions of life in Cuba directly
conflict with the sanitized Dan Rather version.

I purchased a CD-ROM covering all 9 volumes of Police Call, 1999 1st edition from Grove Electronics in Feb. 2000 for $34.95 US.

I cannot get the CD to install properly and have had virtually NO support from "Pozilla Software" who is the writer of this data base.

I have made countless calls from Feb. to present with unreturned calls.

So much for their help line and customer care. It is none existent.

Think twice before you throw your money away on this product.

So far it sits gathering dust, totally useless to me. It does NOT function!

Pozilla Software has a great "I don't care about the customer" attitude.

There are no father's rights in Cuba. Why do you think his mother
died trying to give her child a better life.

I must admit, however, with the way congress is trying to control
every aspect of our lives these days, I am not entirely sure we
will be offering much better in the near future.

What you are getting is called an image frequency. It is a byproduct of
the receive process used in scanners. Try reading up on it at my Glossary
page:

http://www.strongsignals.net/htm/glossary.htm

> What's up? The receive on this radio seems great, I'm getting all the
> Detroit River traffic just fine, but I'm getting this unwanted bleedover
> too.

The BC890 is one of those radios that, due to its design (very weak
receiver front-end filtering), can create a lot of interference on
various bands if you overload the radio (receiving nearby signals
which are too strong for it to handle).

> Lastly, if this is just the way of the world for me, can anyone suggest any
> kind of filter/attenuator that may help out with this problem? I do enjoy
> listening to aircraft, but only when I WANT to and not at other times.

Your best bet is probably to filter out the aircraft band using a filter
that Grove Enterprises carried last I knew: http://www.grove-ent.com/

Good luck!

I have a GRE downconverter I no longer need. I used it to search. That is no
problem. You just enter the edge scans to 400 instead of 800, hook it to the
antenaa
and the 400's are actually 800. I tested it for a few months and it does
work. Just
don't need it anymore. If you can do an edge search and use a step of 30 you
are
set, you won't even need to program individual channels. With the proper
edges (I
can provide these, just need to look them up, and a 30 step you will hit
every cell
channel in the US. It's never this way since the cell towers do not transmit
that far if
you just program in the local channels. I pull a weak signal of maybe 20
miles with a
attic discone. With just a properly set up edge scan when you travel or are
in your
car you will not miss a cell site. With locla programed channels you will
mis allot.
This unit of course is for educational purposes only and should not be used
for the
above.

Instead of using this as a forum to blast Pozilla, why not try and be a bit more construtive? Personally, I realize this is a relatively immature (in other words "new") product and I would expect a few bugs. (Anyone remember products such as Windows 3.0, WordPerfect 6.0, etc.)

Try to explain the problem you are having with the product and see if someone here may be able to help out. Otherwise, quit griping and enjoy your new paperweight.

Whoops! What propaganda have you been reading or, for that matter, propagating?

The father saw the child many times a week. He discovered he was missing when he went to pick him up from school.

A child belongs with jios father. PERIOD!!!!! Damin it! What sort of family values people are you?

I say this from the perspective of a father who had his son seriously interfered with by non-official do gooders who had an agenda that had nothing to do with his best interests. My son eventually died. So don't talk to me about substituting for the father's judgment for what is best for the child.

Bravo Reno!

Best thing the father could now do is spirit himself and his family out of the country and back to their homeland. But no. They will now be held prisoner. In this country.

http://www.strongsignals.net/pastnews.htm

April 16
I just received the following from Melissa Goldman, wife of
Adam Goldman, President of Pozilla Software:

Adam wanted me to send you an e-mail. He was hospitalized
last Monday with a collapsed lung and the office has been temporarily
closed. While the doctors have released him from the
hospital, he has been ordered to bed rest for a couple of weeks. In the
interim, the
office is closed. If you could release a statement that
the office is closed and why it is closed, that would be very
appreciated. Please let
people know that e-mail will be answered at least once a
day until his health improves. I am doing the best I can to keep things
running
like now, but since I do not have the extensive knowledge
of scanners and the software that my husband has, I am very limited on
what I
can reply to. Please assure everyone that Pozilla is still
around and we will do our best to facilitate our customers.

I'm sure I speak for all of us in the scanner community when I
offer our heartfelt wishes for a fast recovery, Adam! Take care of
yourself and we'll be
here, waiting patiently, when the time comes for you to climb
back in the saddle!

Congratulations to Tony Gargano for taking delivery of a
Japanese version of the Icom IC-R3! Perhaps he will be kind enough to
share his thoughts on
the radio with us over the next, few days. That is if he can
pick up on the manual written in Japanese! ;-)

And yes, today was the day that Strong Signals reached the
1,000,000 hit mark! I want to thank all of you who have helped make this
THE place to
be on the Internet when it comes to radio monitoring! We have
all done a lot to help each other where we can, and I think the results
speak for
themself. Thanks for all your support, and long live the
monitoring hobby!

1441. FA: Shinwa SR001 wide band scanner

Newsgroup: rec.radio.scanner
Date: 2000-04-23 00:00:00 UTC
From: "David B. Rogers" <dr7zyq@nidlink.com>

Terry, go to www.radioshack.com
Click on product support, then look under communications products. You'll find the scanner listed there.
The operating instructions and other documents pertaining to the scanner can be found there and printed out.

PRO-2006
(200-0145) Operation Faxback Doc. # 31350

PROGRAMMING THE PRO-2006 SCANNER

1. Select a channel to program by pressing [MANUAL], and entering the channel number you want to program. Then, press [PROGRAM]. "PROGRAM" appears in the display to indicate that your scanner is in the programming mode.

2. Enter a frequency. Good references for active frequencies are Radio Shack's "Police Call Guide Including Fire and Emergency Services,""Official Aeronautical Frequency Directory", and "Maritime Frequency Directory". We update these directories every year, so be sure to get a current copy.

3. Press [ENTER] to store the frequency. If you make a mistake in Step 2, ERROR appears on the display and three beeps sound. Press [CLEAR] and repeat Step 2.

4. Press [DELAY]. If you want your scanner to pause after each transmission before scanning to the next channel, press [DELAY]. "DELAY" appears in the display. If you do not want your scanner to pause, press [DELAY] again. "DELAY" disappears from the display.

5. To program more channels, repeat Steps 1-4. If you want to program the next channel in sequence, just press [PROGRAM} and proceed to Step 2.

SEARCHING FOR AND TEMPORARILY STORING ACTIVE FREQUENCIES

If you do not have a reference to frequencies in your area, use these procedures to search for a transmission. See also "A Guide to the Action Bands".

LIMIT SEARCH

The limit search procedure allows you to search within a range of frequencies. You can store up to ten limit search ranges in the search banks.

1. Press [PROGRAM], and the search bank number in which you wish to store the limit search range. Press [0] for bank number 10.

2. Press [LIMIT]. "L" and the search bank number appears in the display.

3. Enter the lower limit of the frequency range. Press [ENTER].

4. Press [LIMIT]. "L" changes to "H" in the display.

5. Enter the upper limit of the frequency range. Then, press [ENTER].

6. Repeat steps 1-5 to store the limit search range into the search banks. You can store up to 10 limit-search ranges.

7. To recall a limit-search range, press the appropriate bank number.

8. Press [UP-ARROW] to search from the upper limit down to the lower limit. Or, press [UP-ARROW] to search upward starting from the lower limit.

9. When the scanner stops on a transmission, press [MONITOR] to store the frequency in the current monitor memory. The memory number flashing on the display indicates the current monitor memory.

10. Press [UP-ARROW] or [DOWN-ARROW] to continue the search.

NOTES: Press [SPEED] to speed up or slow down the search.

Press [DELAY] to make the scanner pause 2 seconds after a transmission, before proceeding to the next frequency.

LIMIT SEARCH MEMORY

When you change your scanner's mode from limit search to manual, program, scan, direct search, and so on, your scanner retains the last frequency before you change the mode. Your scanner resumes the search from that frequency when you change the mode to limit search again.

NOTE: You can change the upper or lower limit frequency without afecting the memorized frequency if the frequency is within the new limit range. If the frequency is out of the new limit range, the search starts from the new upper or lower limit frequency.

DIRECT SEARCH

1. Select a currently programmed channel by pressing [MANUAL], and the channel number. Then, press either [MANUAL] or [PROGRAM].

2. Press [DIRECT]. The step frequency appears in the display.

3. Press [UP-ARROW] to search through higher frequencies or press [DOWN-ARROW] to search through lower frequencies.

4. When the search stops on a transmission, press [MONITOR] to store that frequency in the current monitor memory. The memory number flashing on the display indicates the current memory number. To continue the search, press [DOWN-ARROW] or [UP-ARROW].

NOTES: When you press [DIRECT] during limit, your scanner enters direct search mode.

When you press a numeric key during a direct search, your scanner changes to limit search mode. The key you press corresponds with the limit-search bank number.

MOVING A FREQUENCY FROM A MONITOR MEMORY TO A CHANNEL

As you store frequencies in monitor memories, the memory number flashing on the display shows the current monitor memory. You can listen to monitor memories by press [MANUAL], [MONITOR], then the number of the monitor memory you wish to listen to.

If there is a frequency you wish to transfer to a channel, follow these steps to move it from a monitor memory

1. Press [MANUAL]. Enter the channel number you want to store the monitor frequency in; then press [PROGRAM].

2. Press [MONITOR] and enter the monitor memory number that has the frequency you want to move.

3. Press [ENTER]. The scanner stores the monitor frequency in the channel.

If you want to return to a limit search after this procedure, press [LIMIT], and the search bank number. Then, press either [UP-ARROW] or [DOWN-ARROW] to continue searching.

USING THE RESTART SWITCH

The scanner's display might lock up the first time you plug in and turn on your scanner, or if the battery is left out for an extended period of time. If the display locks, use a pointed object, like a paper clip, to press and release the restart switch while power is on.

To clear all the memories, be sure the scanner is turned on and:

1. Press and hold [CLEAR].

2. Using a pointed object, press and release the restart switch.

3. After confirming that the display goes blank, release [CLEAR].

SETTING THE VOLUME AND SQUELCH

Follow these steps to set the volume and squelch.

1. Turn VOLUME clockwise and SQUELCH counterclockwise until you hear a hissing sound.

2. Adjust VOLUME to a comfortable sound level.

3. Slowly rotate SQUELCH clockwise until the hissing stops.

NOTE: If the scanner picks up unwanted, partial, or very weak transmissions, rotate SQUELCH clockwise to decrease the scanner's sensitivity to these signals.

USING THE SOUND SQUELCH SWITCH

If the scanner stops at a transmission during scan, search, or priority modes, the [SOUND SQUELCH] switch lets the scanner start scanning again if

the transmission contains no sound (carrier only without modulated signals).

If you scanner stops at a frequency that has no sound, press [SOUND SQUELCH]. The indicator lights. If the scanner detects no sound within 0.5 seconds, it goes to the next transmission.

When the scanner receives a frequency that contains sound, it halts at the frequency. If the sound ceases, the scanner stays on the frequency for 5 seconds, and then resumes scanning. If the carrier stops, the scanner begins to scan immediately if the delay function is off, or after 2 seconds if the delay function is on.

To cancel sound squelch, press [SOUND SQUELCH] again. The indicator goes off.

NOTE: If a frequency contains a transmission with low modulation, the sound squelch circuit might not work properly.

SCANNING THE CHANNELS

To begin scanning the channels, just press [SCAN]. Your scanner scans through all the channels that you have not locked out of the banks that are turned on. Set SQUELCH so that you do not hear hissing sounds between transmissions.

Be sure to read the following sections to get the full benefits from all of your scanner's special features.

USING THE DELAY FEATURE

Many agencies use a two-way radio system that might have a pause of several seconds between a query and a reply. To program a delay into that channel to keep from missing a reply, select the channel and press [DELAY] so DELAY appears on the display.

When your scanner pauses at an active channel which has been programmed with a delay, while scanning, it waits for 2 seconds after the completion of each transmission on that channel before it resumes scanning.

Some radio systems, especially those above 800 MHz, use a special "trunked" system. In these systems, the transmitter selects an available frequency each time the operator keys the radio. Therefore, it is possible for the query to be on one frequency and the reply on another. To ensure the best possibility of hearing the full reply, you want the scanner to begin scanning immediately when the first transmission ends. In this case, select the channel manually and ensure that "DELAY" is not in the display. If "DELAY" is indicated, press [DELAY] to turn off this feature for that channel.

SETTING THE SCANNING SPEED

While you are in scan or search mode, you can press [SPEED] to select the scanning speed.

The scanner has 2 different scanning speeds:

13 channels per second
26 channels per second

LOCKING OUT CHANNELS

You can increase the effective scanning speed by locking out specfic channels that you have not yet programmed. Manually select the empty channel and press [L/OUT] so that "LOCK OUT" apperas on the display. This is also handy for locking out channels you have programmed that have a continuous transmission. You can still manually select locked-out channels.

To unlock a channel, manually select the channel and press [L/OUT], Or, press [L/OUT RVW] in manual or program mode to call out locked-out channels one by one. Then, press [L/OUT] again.

NOTE: There must be at least one active channel in each bank. You cannot lock out all channels.

TURNING BANKS ON AND OFF

As explained in "Understanding Channel Storage Banks and Search Banks" your scanner splits the 400 channels into ten banks of forty channels each. The small bars under the numbers at the top of the display are the bank indicators. You can turn each bank on and off, so that all the channels in a bank are either scanned or locked out. In scan mode, press the number key for the bank you want to turn on or off. If the bank indicator is on, you have turned on the bank and the scanner scans all the channels within that bank that you have not locked out. If the indicator is off, the scanner does not scan any of the channels within that bank. You can still manually select any channel in a bank, even if you have turned off the bank. You cannot turn off all banks - one must be turned on.

PRIORITY

You can scan through the programmed channels, and still not miss an important or interesting call on a specific channel. To program a stored channel as the priority channel, press [PRI] during scanning. The scanner now checks the priority channel every two seconds, and stays on the channel if there is any activity.

To turn on the priority feature, press [PROGRAM] and the desired channel number. Then press [PRI]. "P" appears on the display whenever the scanner is set to the priority channel. You can only program one channel as the priority channel. If you program a new channel as the priority channel, the previous channel you chose is automatically cleared.

To turn off the priority feature, press [PRI] until "P" disappears from the display.

NOTE: Channel 1 is automatically designated as the priority channel the first time you turn on your scanner.

MANUALLY SELECTING A CHANNEL

You can continuously monitor a specific channel without scanning. This is useful if you hear an emergency broadcast on a channel and do not want to miss any details-even though there might be periods of silence-or if you want to monitor only a locked-out channel.

Follow these steps to manually select a channel.

1. Press MANUAL.

2. Enter the channel number.

3. Press MANUAL again.

Or, if the scanner is scanning and stops at the desired channel, press MANUAL one time. (Pressing MANUAL additional times causes the scanner to step through the channels.)

DIMMER

Press [DIMMER] to turn the display's backlight down or up.

HEY EVERYONE.

Have I got a GREAT deal for someone out there. HERE is what I have to sell. MUST GO!!! Trying to raise $8000,00. for a CISCO class.

AOR 8200 US VERSION

DDM-P-4 2/4 LEVEL CONVERTER (Texas-2-Way)

AOR Computer Control Lead (Professionally modified with discriminator output)

All ORIGINAL parts and accessories.

INSTRUCTION MANUAL

ORIGINAL PURCHASE RECEIPT

Radio Shack Telescopic Antenna.

10' section of RG-8 Cable and assorted converters and connectors

Radio Shack Glass Mount Antenna. (Has Been Installed On My Car)

Larsen Glass Mount Antenna (Also Been Mounted on My Car. Paid over $100.00 last week for it)

Stainless Steel Computer Case (Brand Name: ZERO. Originally designed for "CLASSIFIED" Laptop Computer. Hinges on the back of the case have been"CRIMPED" to prevent tampering or removal of hinge bar.)

I WOULD RATHER SELL IT ALL AS ONE UNIT.
I WILL PAY SHIPPING SECOND DAY.
U.S. CUSTOMERS ONLY.

$$$ MAKE OFFER $$$

PERSONAL NOTE: I AM AT VERY CRITICAL POINT IN MY LIFE AND CAN NOT AFFORD TO BE CHEATED OR ROBBED.

I HAVE ONLY HAD THIS UNIT AND ITS ACCESSORIES FOR ABOUT 1 MONTH. EVERYTHING IS IN MINT CONDITION. NO SCRATCHES OR ANYTHING.

FIRST COME FIRST SERVE.

CONTACT ME VIA TELEPHONE ONLY PLEASE. SEND ME AN EMAIL IF YOU CAN NOT GET THROUGH.

THANK YOU AND HAVE A GREAT DAY.....

Robert L. Green Jr.

I'm looking for a cross-reference for Radio Shack/Realistic scanners.
Something like "20-412 = PRO-2006", "20-138 = PRO-37", etc.

Anyone know where I can find such an animal?

Thanks in advance.

I haven't had much luck w/ the newer Radio Shack catalog # system.
You've probably already looked here, but in case you haven't...

http://www.radioshack.com/ProductSupport/Frames/

BTW - I have a PRO-30 as my only scanner... Okay, quit laughing!

I believe you will find that to be totally incorrect
based on the actual text from part 97 which makes
absolutely no prohibition to avoidance (regularly or
not) of telephone usage. 97.133(a)(5) in case
you missed it from his post.

Cheers,
Bill K2UNK

yeah that is one of the comparisons you will hear, and there are many more, often between units that are very different. It does not mean the manual is interchangable or the buttons match, it simply means somewhat similar. You cannot exchange parts between them, the pro 43 is MUCH faster, the 2006 is MUCH easier to modify for cell, the 2006 has much larger display characters but the backlight goes out, the 43 will not pickup frequencies below 30mhz, the 2006 gets all the way up to 1300mhz, plus the 2006 gets a LOT of frequencies where the 43 has gaps like 174 to 220, 54 to 118,etc., the 43 only goes to 999mhz, The 43 gets 200 channels, the 2006 gets 400, 2006 is 12 volt, 43 ie 9 volt, go to Radio Shack and look at the specs for each, you will see how different they are. When it comes to trunking, data skip, and 300 frequencies per second, they are both very old....

This would be an interesting project. We could also add the first and last years the item appeared in RS catalogs, (again, I would REALLY like to get some old RS catalogs! hint, hint) and some simple info - number of channels/banks, 800 MHz, cell-capable, etc. It wouldn't need to be EXTREMELY fancy.

In fact, I may start working on a MySQL-backed DB with web entry form for just this purpose. People could add their own info directly from the web. I think I can hack it together from the MySQL based AddressBook I did some work on a month or two ago. However, if anyone with more MySQL/Perl experience would like to assist, please let me know!

Rocky,

The Goddard Amateur Radio Club (GARC) at Goddard Space
Flight Center retransmits the Shuttle audio during missions.
You can get the frequencies from the GARC web site at

http://garc.gsfc.nasa.gov/www/garc-home-page.html

The frequencies are under the Shuttle retransmission FAQs.
You can also find additional frequencies through the AMSAT
link on the home page.

73,

Tim

> relatives in Miami?

That is a bold and, thus far, unsupported assertion! Cite your sources. It seems to rank right up there with your recently espoused endorsement of the observation that hispanic females were (as I recall it) "disco-sluts". Nothing like Bryant style objectivity. To your mind these hispanic folks are living proof that "it takes a village" to properly raise children, eh, Bryant?

If there's "white trash ilk" in this newsgroup, Mr. Morisseau, it's
trash like
you who would put politics above a father-son relationship. At least Mr.

Gonzalez isn't holding him up to the media 24 hours a day, like the
Miami-alcoholic relatives did. And when I attacked real racist remarks
in this
group, you went ballistic. I think we know what garbage can you're
politics
slimed out of.... Maybe your removal might be considered if we're
engaged in
the "beautification" of this nation.

Bryant

Off the meds again are we, Bryant? Better have the doctor check
the dosage. A shame. You were showing so much promise with your newfound
resolution to forswear provocative and disruptive outbursts. One has to
wonder just how Weber State manages to reconcile your endorsement of
references to hispanic females as "disco-sluts"? Is this kind of thing
good for the University or bad for the University?

As ever,

Dan

This is a bunch of complete and utter nonsense. Violation of WHAT?

I could use an autopatch from my car to call my wife at home and ask her if we need anything at the store. Then I could say, "Gee, isn't this club's autopatch great? Think of all the money we're saving by not paying Airtouch for this call." You think the FCC is going to come knocking on my door to pull my license? How ridiculous is that?

1467. Decoding digital signals with BC245

Newsgroup: rec.radio.scanner
Date: 2000-04-24 00:00:00 UTC
From: Michael Kellogg <Michael@kelloggs.org>
Message-ID: <sgadvr2lcdo168@corp.supernews.com>
Source record: 89570

Having mastered (right) conventional scanning with my new BC245, I've decided to attempt digital signals before moving on to trunked systems (trudging through the "trunked systems" section in the manual made me dizzy). I've read up on MDT's, pagers, and ACARS, which seem to be the most interesting and readily available. Also dl'd MDTMON, POC32, and WACARS07 as weapons of choice.

I understood that a discriminator in the output from the scanner to the mic input on my laptop was required to level out the signal. However, I couldn't find info on it for the BC245 in the lists I was reading, and one of the computer interface app's I use, BC245INT, has a "Monitoring Discriminator" selection which seems to dramatically affect the output when activated. However, neither program has produced anything at all (well, POC32 flashed a "valid reception" icon pretty often, but never produced any output of any kind). Since I'm new to this, I don't know if this discriminator ain't working, or the freqs I'm using are actually for something else (ie. I don't know what the signals are supposed to sound like), or my volume is too high, or what. And the POC32 documentation is only in German (yay!).

I haven't even opened up WACARS07 yet because I want to get my feet wet in these other areas first. But I DID try several of the recommended freqs for the ACARS signal and came up empty.

I know this seems pretty open-ended, but any resources or suggestions to get me on the right track would be greatly appreciated. Thanks.

Truely odd signal. It is definately data, as you can hear the carrier waves. If I were to guess just off the top of my head its a high speed asynchronous data link with the carrier waves occilating tones between send and recieve. But the again, I'm more of a 'puter hack than a radio geek.

Have to admit you have an interesting point there.....which just goes
to prove even more that the Government doesn't know its butt from a
hole in the ground when it comes to what is best for my children.
However, if I abuse my children, they should be taken away, but not
because they want to endoctrinate them in the in liberal, conservative,
or any other kind of views like Cuba.

As crappy as Congress is getting, I would still rather live here.
Be nice if he and his son could live here in peace and freedom and
help us straighten out our government. I would welcome them to stay.
But, Castro has other ideas.

I had the same luck as you did. I then went to Rat Shack, picked up a 1/32 plug went home & soldered a piece of thin speaker wire to the center lug. I used 18" of wire & can pick up frequencies from passing barges on the Ohio River about 3/8 mile away. Be warned that if you live in a freq. infested area, it will lock on to the strongest signal.

Good Luck,
Charlie

You're comparing commercial systems to amateur systems? Why on earth
for? What amateur can afford to set up a system costing billions of
dollars and hire the man-power with its associated millions of man-hours
per year to keep such systems up and running?

On the other hand, I can sit down with a soldering iron and build a
complete station from scratch, and be on the air -- total time would
probably take a day -- less if I had all the parts in my junkbox.

Apples and pineapples.

1475. Use of Satellites for Mind Control and Acts of Torture?

USE OF SATELLITES FOR MIND CONTROL AND ACTS OF TORTURE?

Psychotronics users have been attempting to retaliate for
my exposure of them on the web with intensified assault.

As has happened on many, many occasions before, on the afternoon
of April 20, 2000, it was definite (beyond question) that there
was a highly focused high-energy beam aimed at me from directly
overhead in space. It was radiation of extreme penetrating
power, which I surmised to be either X-rays or gamma radiation
focused into a directed beam like a laser. One of the
characteristics of this radiation is that there is a lightning-
rod-type effect. The target is safer at an intermediate level
of a house rather than in the basement because there is an
attraction of the energy to ground, and it is actually more
intense in a basement. It penetrates easily through several
feet of earth, steel plates, and a foot and a half of concrete.
That can't be microwaves, can it? There is usually no heating
effect. It easily penetrates the aluminum siding of the house,
plus an aluminum folding table, plus a quarter inch steel plate
--only slightly diminished in intensity. This radiation has to
be high-energy. It is being used as a vehicle for mind control
transmissions and also as a vehicle for torture of subjects.
It transmits voice-to-skull and ideas and mood changes (actual
telepathy). The radiation used causes swelling of tissue (when
intense), muscle and joint pains, and some of the symptoms of
radioactive fallout and is also used for thought control (but
sadly more often for thought suppression). The technology has
been honed to the point where beams are highly directable to
target (within centimeters or even millimeters) from great
distances. The radiation is also used as a carrier wave broad
enough to fill a building or a city block. Maybe I have been
the target for more than one type of radiation (different
frequencies for different effects), but most of it fits the
above description.

In this particular instance it had to be aimed from a
satellite, a station in space, or an overhead airborne craft
because of its definite direct vertical direction (straight
down).

It can also be ground-based in origin (supplemented by ground-based
weapons once they decide to target a victim). I surmise this
because some of the beams aimed at me have also seemed parallel

to the ground. So don't completely forget possible adversaries on the ground at close range. It is actually not that easy for a victim to determine exactly where they are coming from because the through-the-wall technology is hidden from view inside buildings, from which perpetrators wage guerilla-type warfare. The directed energy has a pretty good range.

Harassment continued into the days following. At about 4:00 A.M. on April 22, 2000, I awoke to find myself the target of an incredibly intense beam aimed at my head as I slept on the living room floor under a metal table (plus a wall plate). It was obviously a punishment beam. I had given up sleeping in my bed upstairs because of recent harassment there with intense radiation beams as I slept. There was transmitted the heavy roaring of what sounded like loud whirring jet engines in the background and a male voice engaged in a countdown from ten. When he reached zero he uttered the word "Jackpot!", as though a target had been hit. It sounded as though I was attached to someone doing a launch or detonation of some kind. It came from the same location as someone maneuvering these intense radiation beams directed from an overhead source with which I have been tortured lately. The voice had no perceivable foreign accent (sounded American). I've considered some type of hovercraft, but there is never any of these in sight. I did not actually go outside to check. The irradiation occurred over a prolonged period of time, not momentarily. It sounded like a jet launch and missile countdown from some war zone. Other possible explanations are that someone was feeding in recorded sounds or was watching a war film while transmitting.

I have been a mind control target utilizing psychotronic weapons since late 1973. My knowledge of their crimes has made me a target of continuous harassment, terrorization, and torture designed to break me. Perpetrators have been tracking me with long-distance telemetry everywhere I go. They refuse (for close to 30 years now) to let me alone, overzealous to extinguish every last trace of evidence of their plot. Apparently, all victims are driven crazy and phased out into mental institutions, disposed of through suicides, or goaded into violent behavior which necessitates their removal from society (and various other disposal methods). Perpetrators like their selections to be terminated, particularly the lucid ones. They espouse something like Naziism and profess total amorality at times. They were bothering my now somewhat developmentally disabled brother Bill for several years prior to switching to me. I can tell from unmistakable behavior symptoms, like seemingly unprovoked fits of violence and other visible responses.

Had the perpetrators not been so thorough about viciously tidying up loose ends by trying to dispose of innocent witnesses they might not have this report out on the Internet. I would not have been as tenacious as I am about exposing them, not caring what

anyone thinks of me as a result, might have gone on with just living my life as it was supposed to be lived. They are so damn vicious that they necessitate these retributions. There is no just forgetting about them and going on with life as usual. From which the public only stands to benefit anyway. It is best forwarned about these developments, which are NOT in any safe hands.

This is not a good development. These satellites or stations ought to be addressed by a conference of concerned nations. From my viewpoint, the only safe solution is to peacefully disable these satellites or stations (via missiles or other means) so that they can no longer pose a threat to the denizens of our planet--the threat of a military complex obtaining a global monopoly and enslaving us all. The wasted defense budgets should be immaterial. This is necessary for the integrity of our minds, bodies, and properties and for the normal functioning of legitimately elected governments. The populations of the world are kept totally ignorant of this horrible threat while the means for their enslavement proliferate. They are lied to by news media and politicians while horrible behind the scenes abuses occur with the weapons.

I don't know if the Star Wars program was related or not, but it did involve beam weapons in space. Ronald Reagan was the U.S. president who initiated it. He seems to have undergone some kind of brain deterioration since then--a normal product of aging? Or is he another pawn phased out by military forces controlling this space hardware, either our own or a rival clique? They insist on phasing out participants to be assured of maximum security. There were attempts again and again to wreck my brain with powerfully focused beams even before I publicized their existence on the net. At any rate, they could easily cause stroke in an elderly person.

It is just a peculiar roll of the dice that it falls to me to break the news to the population. It should actually be a defense official. Most of the victims for testing were overwhelmed by the experience, and few were computer savvy. I notice that a number of those smart enough to be vocal on the web were either slightly unconventional or engaged at some time in some form of dissent (atypical religions, minorities, foreigners, criminal types, criticized government policies, or simply knew too much). Others were just assessed to be easy prey.

Perhaps one individual can't really make much of a difference confronted with so colossal a problem, but collective interest might if the truth could be verified. The way is being paved for a global police state based on torture, terrorization, and fascist mind control.

Theoretically, what goes up can come down. It might be possible to disarm satellite systems by knocking them out with missiles or with their own medicine--directed energy. I read something in a newsgroup about EMP weapons (electromagnetic pulse) being suitable for this purpose. The presence of these systems can lead to nothing but tyranny. Do you want anyone poised overhead both ready and willing to fry your cranium the moment you arouse their ire?

Call your credit card company and have them remove the charge and get
your money back for you. The merchants are bound for 6 months after a
sale by contract that the credit card issuer can take back thier money
right out of the merchants bank account.

Since you can't get any use out of the disk, your liability for paying
for the merchandice would theoreticly be the value of the plastic and
the cardboard of the disk and box.

Stick it to them, and get your money back the hard way, and thenlet them
all go pound sand!

Glad you agree. That is exactly the point as to why
ham radio still attracts new comers...and will for a
long time. Why do some people hunt with a bow
and arrow instead of a rifle? Why do some of us
own and operate antique cars. MOST of ham radio's
attraction is recreational...and always has been.

The one area we can always help with is emergencies
of major scope. We then are there to assist...as has been
well reported for several hurricanes, floods, etc over
the last few years.

Cheers,
Bill K2UNK

Every year? In the last year I have spent no more
than $200 on ham radio. I have had my HF+6m
Kenwood rig for eight years. Paid $1500 new
for the rig. That is less than $200 a year over
the eight years. You can bet my phone bill
goes WAY over that on an annual basis.

Bull
If thatwere true then all those "honey-do" QSOs
to pick up a loaf of bread, etc would be illegal.
They aren't.

Cheers,
Bill K2UNK

Nothing I said made any claim that I talked worldwide
on 2m. Andy W certainly read my comments correctly.
BUT...just for the record, I know hams that HAVE
talked worldwide on 2m using satellite. AND they did

that with an HT in some cases.

>Ham radio has value as an electronics training medium, but it's true

So tell us what happened when AT&T, Bell Atlantic, etc went
belly-up in servicing areas in norther NJ during hurrican
Floyd. I probably have just as much telco background as you
(worked for AT&T Long Lines, AT&T HQ, Bellcore, AT&T, etc.)
and there isn't a system around that can't go down when
an entire central office is under water.

>The weak
>spots in telecom are all exposed to weather, as in outside plant, and
>with current diverse routing, even they aren't that weak.

Routing traffic around a problem area doesn't provide
service to those served by the central office that is
under water.

>Once apon a
>time when there was ONE local phone company and ONE national connector,
>the chances of failure were much greater, and even then, it never really
>happened.

And today, the last mile to your home is STILL via that
same serving central office...regardless of who gives
you the dial-tone.

>I listen to plenty of traffic on 2m, 6m, 1.25m, and shortwave. How many

In an emergency, give me one ham with a working "appliance"
mobile over an engineer with no equipment any day.

>Could you fix, or at least troubleshoot to a proprietary component, your
>own HT?

Probably...I did for years on the older component
level stuff. Today I can't be bothered because
the stuff is too small for me. Additionally, what difference
does it make. No one does field repairs on that
stuff anyway. Indeed, if you have the claimed experience with

large telcos, you know that they don't do component
level field repairs either...they just diagnosis to a bad
circuit pack and then ship it to a central depot
for repair.

Bottom line, what's your point?

>I'm not a ham operator. I've studied all the tests, and every year I

>provided on the online test sites, for all of the license classes. I
>have ZERO interest in learning Morse code, so I'll never progress beyond
>the Tech, except for the commercial licenses which don't require code.

And a number of commercial licenses aren't even around
anymore. The FCC dropped requirements for commercial
licenses to do repair on private radio equipment, etc.

I'm not sure just why you state what you do. Indeed, I
have been a vocal opponent of code testing for years,
but you can't even find the time to get the nocode
tech. Give us all a break. You are entitled to your
opinions, but maybe they'd be a tad bit more believeable
IF you got that nocode tech.

Seems someone of your
knowledge would take no more than 30 minutes
